Commit and push with GitHub Desktop

Digital Technologies · School computers

You will

- save a scene in Godot, in a scenes folder
- commit your changes and push them to GitHub
- check your work is on GitHub

You need

- your Godot project open in Godot
- your project already on GitHub (see the guide Put a Godot project on GitHub)

Before you start

- Do this every lesson, before you leave.
- Already have a scene to save? Skip the first step.

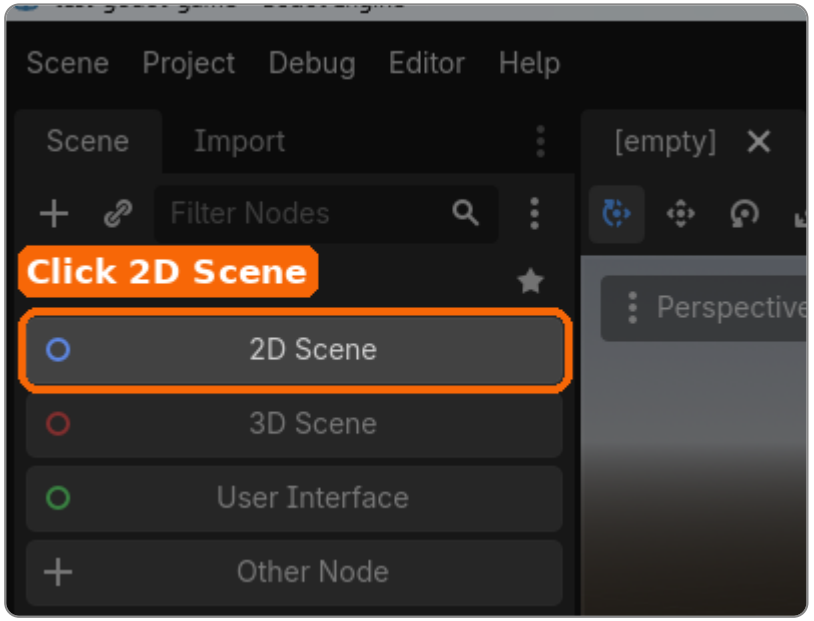

1

Godot › Scene dock

Under **Create Root Node**, click **2D Scene**.

A scene needs a root node before you can save it. **2D Scene** makes one called `Node2D`.

If something goes wrong
Godot says a root node is required: click **OK**, then click **2D Scene**.

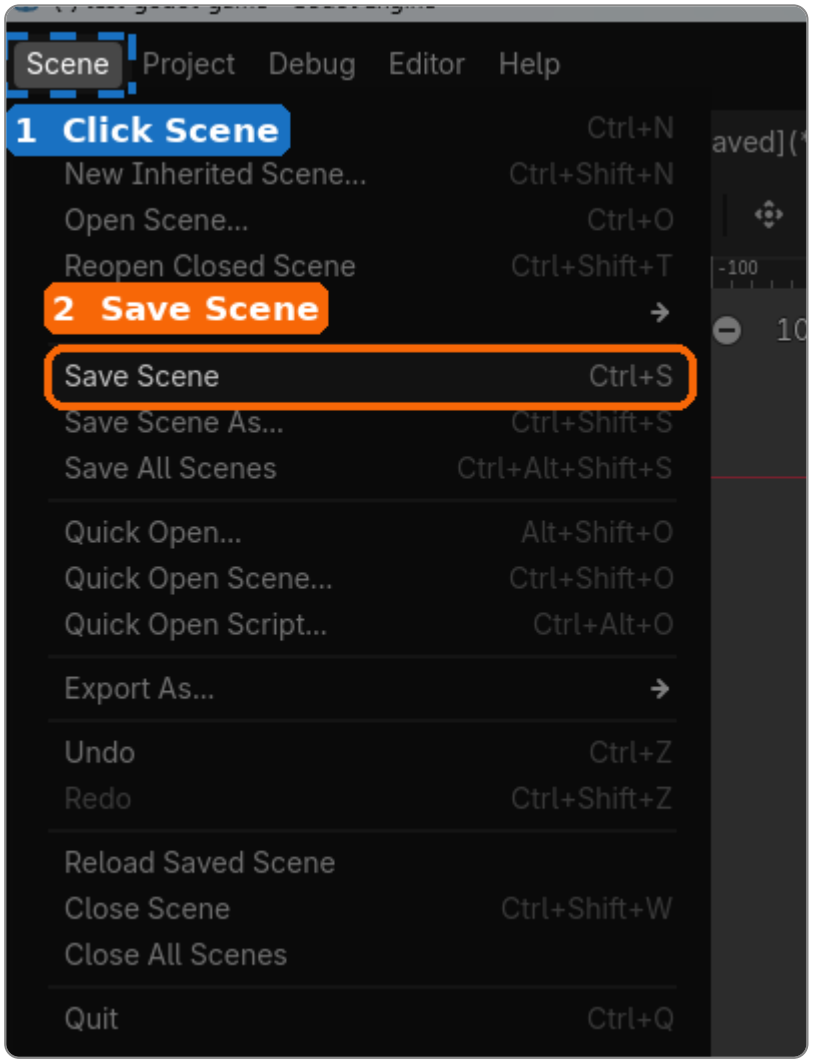

2

Godot › Scene menu

Click **Scene**, then **Save Scene**.

Or press `Ctrl` + `S`.

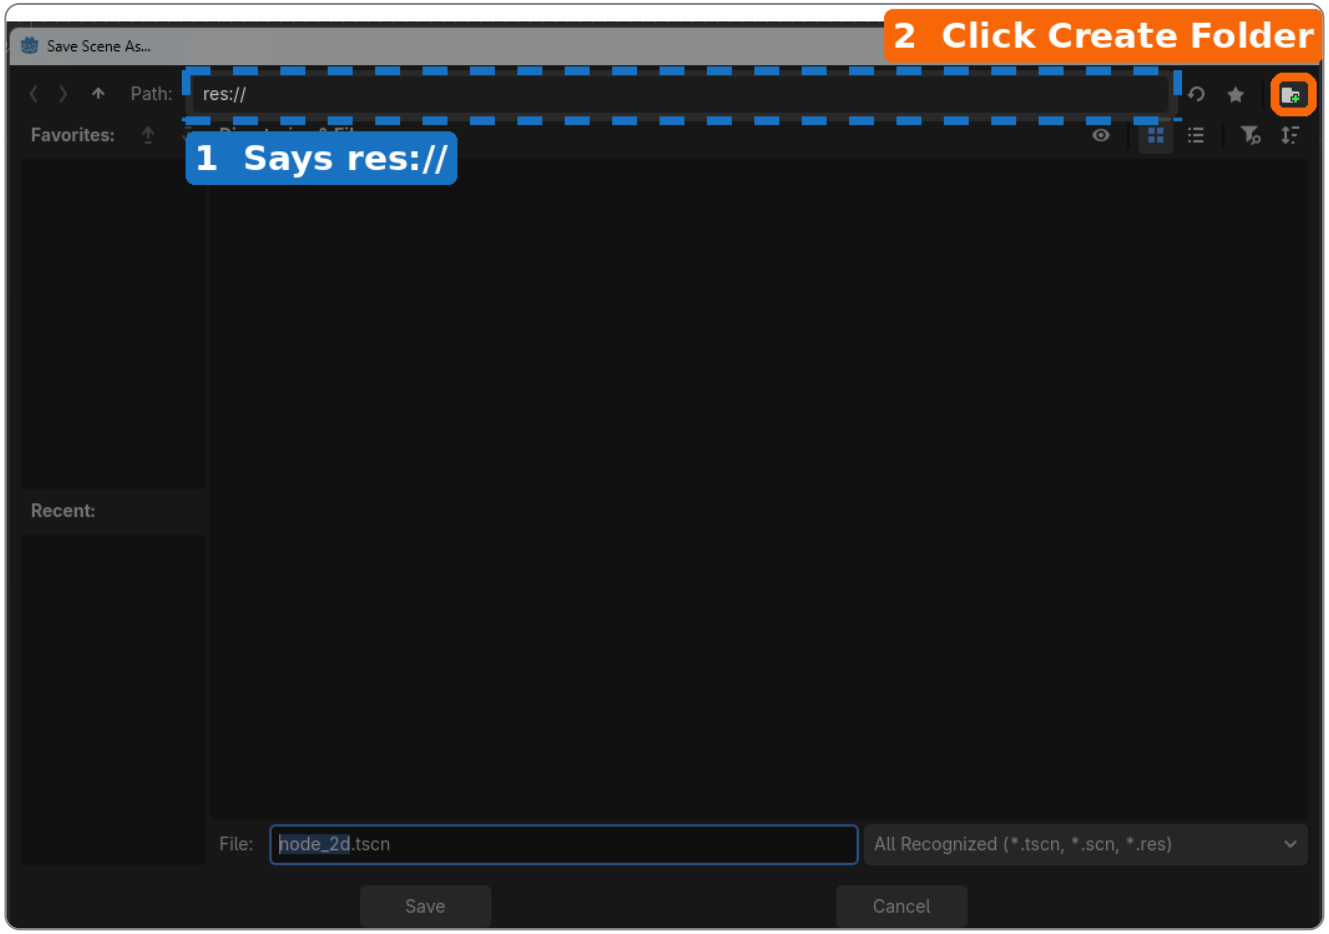

3

Godot › Save Scene As

Is there a `scenes` folder? Double-click it, and skip the next step.

No `scenes` folder? Click the **Create Folder** button (top right).

Keeping every scene in one folder makes your project easy to find your way around.

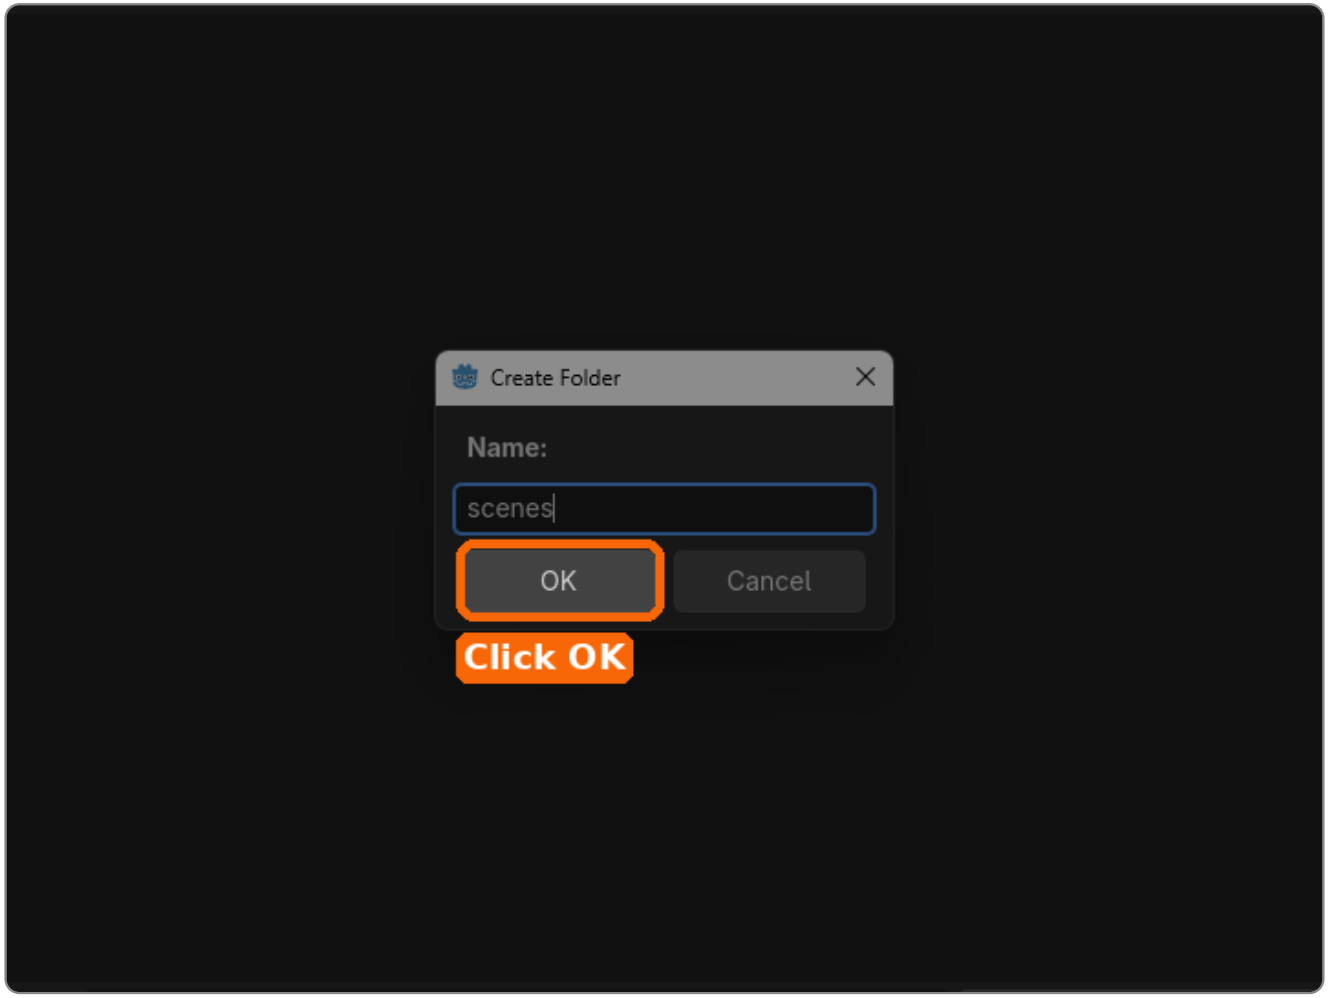

4

Godot › Create Folder

Type `scenes`, all lowercase.

Click **OK**.

Godot opens your new folder for you.

5

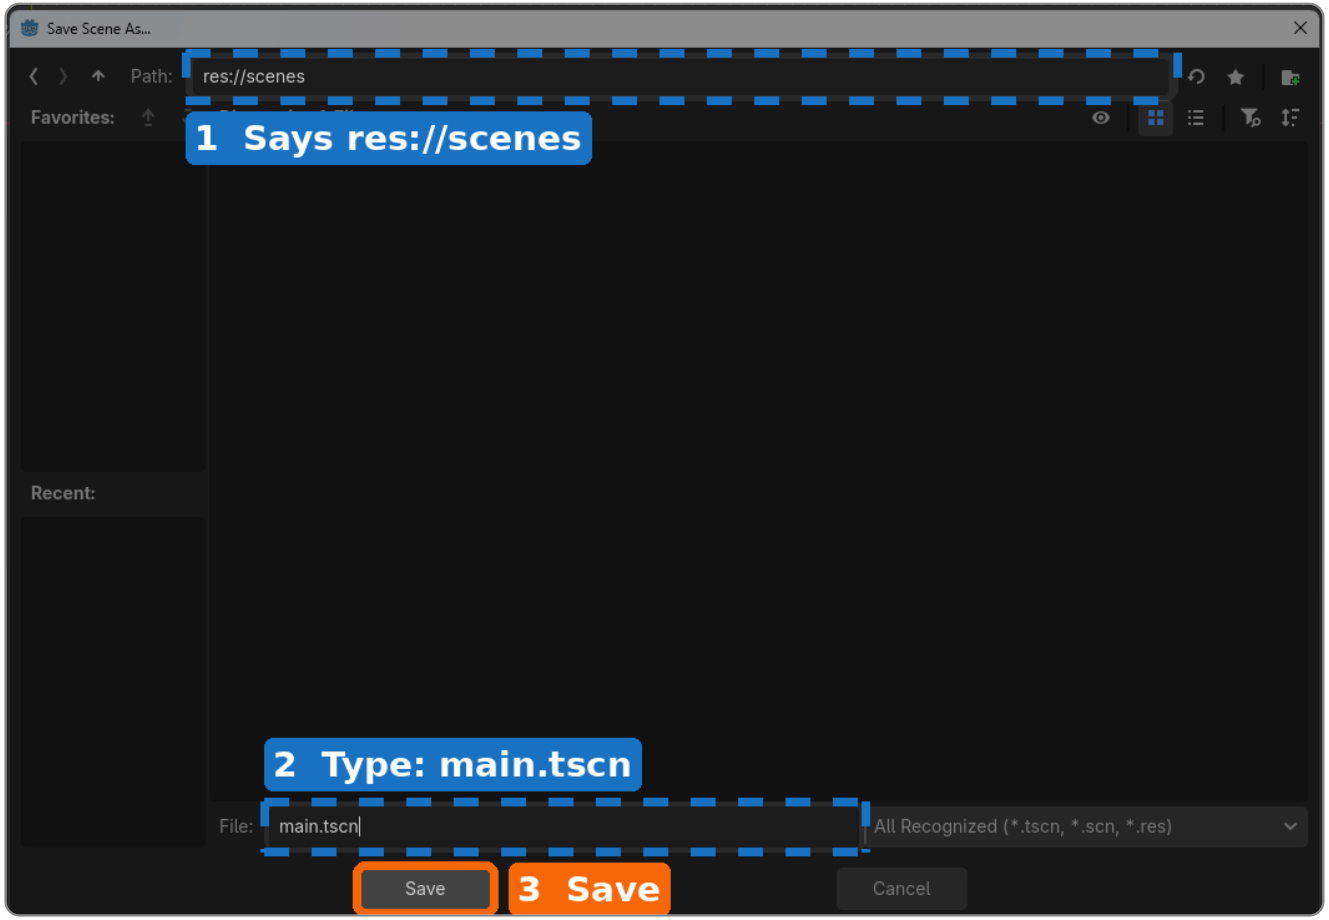

Godot › Save Scene As › scenes

Check **Path** says `res://scenes`.

In **File**, type `main.tscn`.

Click **Save**.

Use lowercase, with underscores instead of spaces: main.tscn, start_menu.tscn.

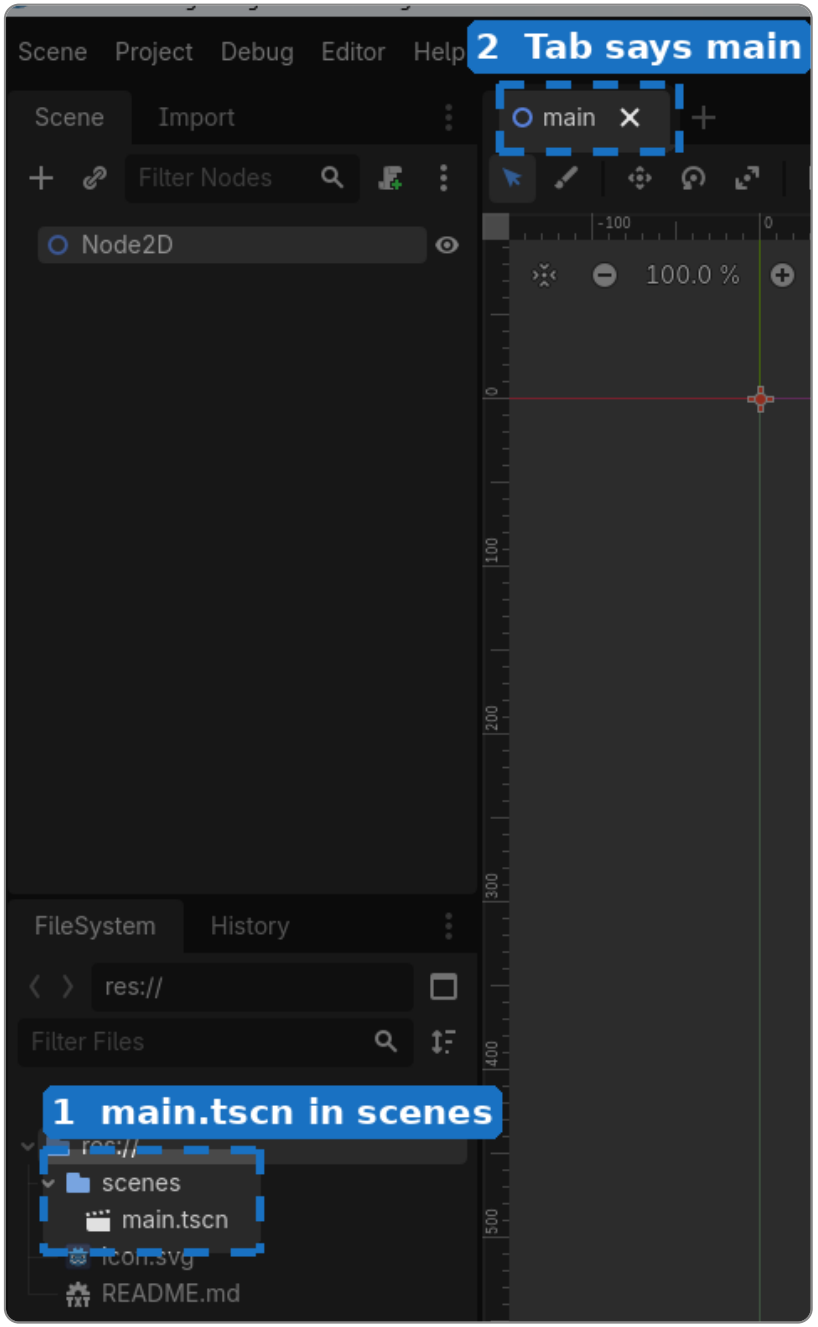

6

Godot › FileSystem

Check **FileSystem** shows `main.tscn` inside `scenes`.

> **Check:** the tab at the top now says **main**.

7

GitHub Desktop › Changes

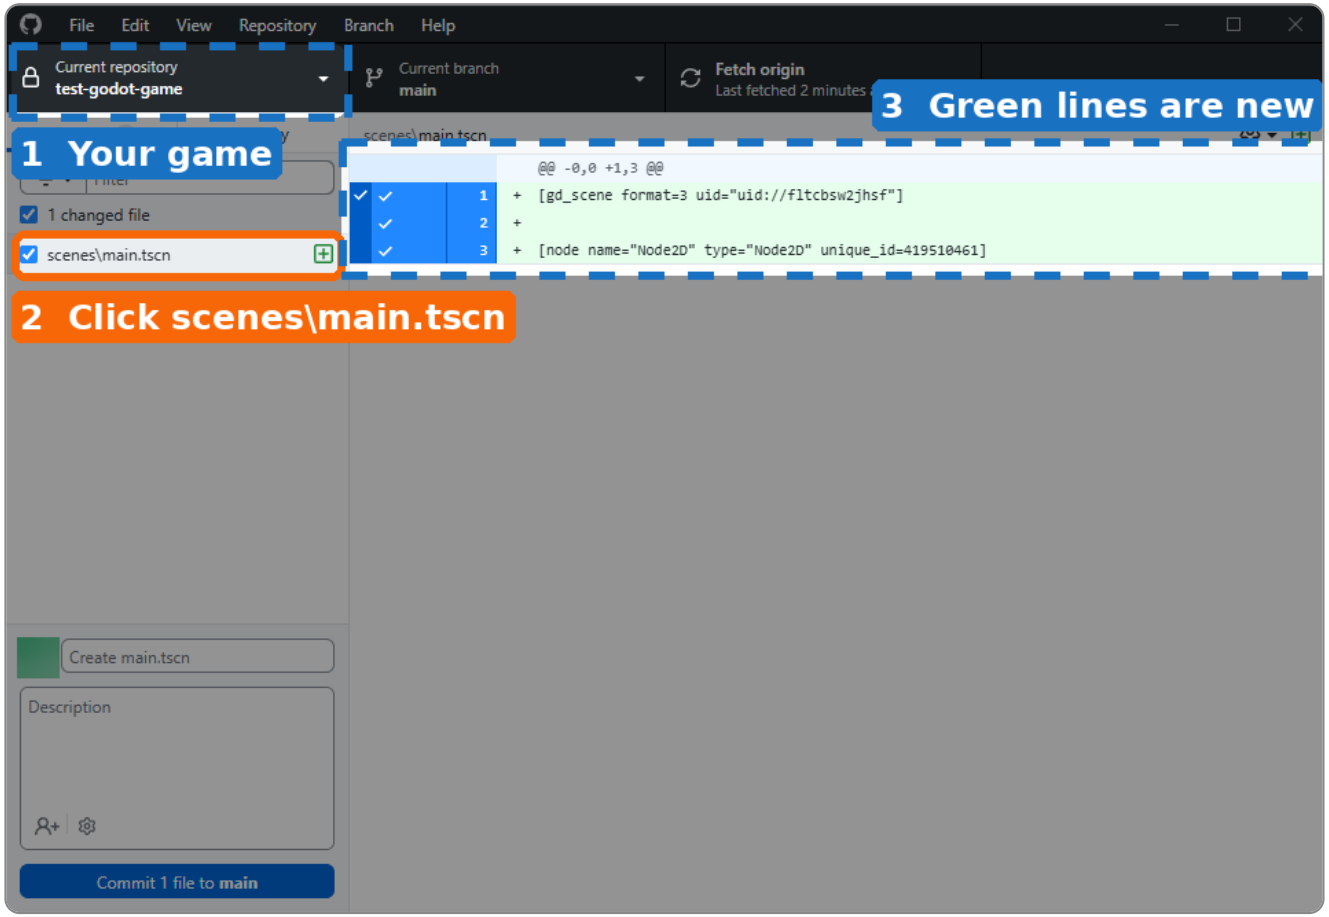

Open GitHub Desktop.

Check **Current repository** shows your game.

Click `scenes\main.tscn`.

Green lines are new. Red lines are removed.

If something goes wrong
Nothing in Changes: go back to Godot and save (Ctrl + S).
Files from a .godot folder are listed: your project is missing its .gitignore. Ask your kaiako.

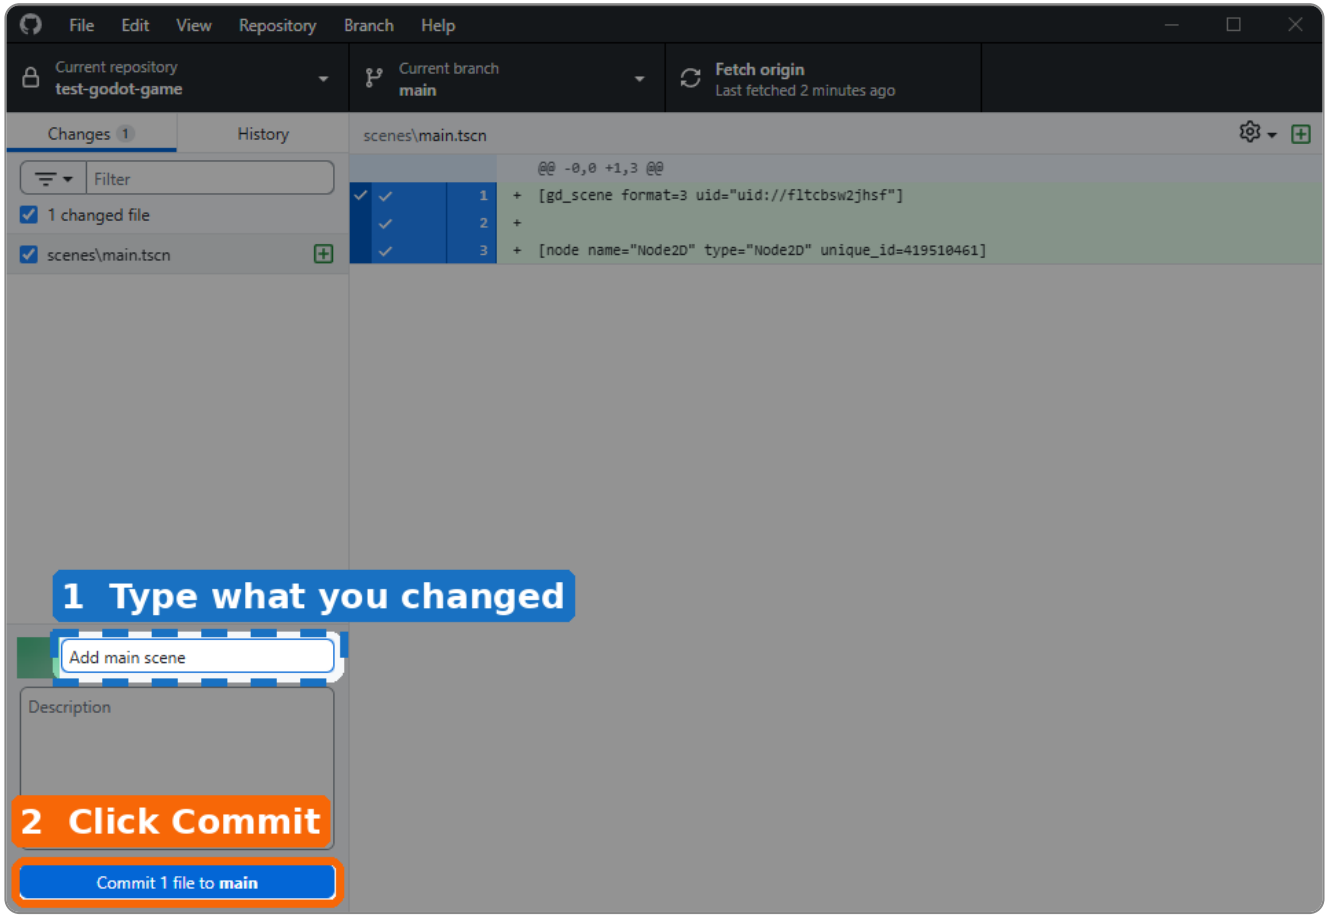

8

GitHub Desktop › Changes

In **Summary**, type what you changed.

Click **Commit 1 file to main**.

Say what you did, like `Add main scene` or `Add player movement`. The button says how many files you're committing.

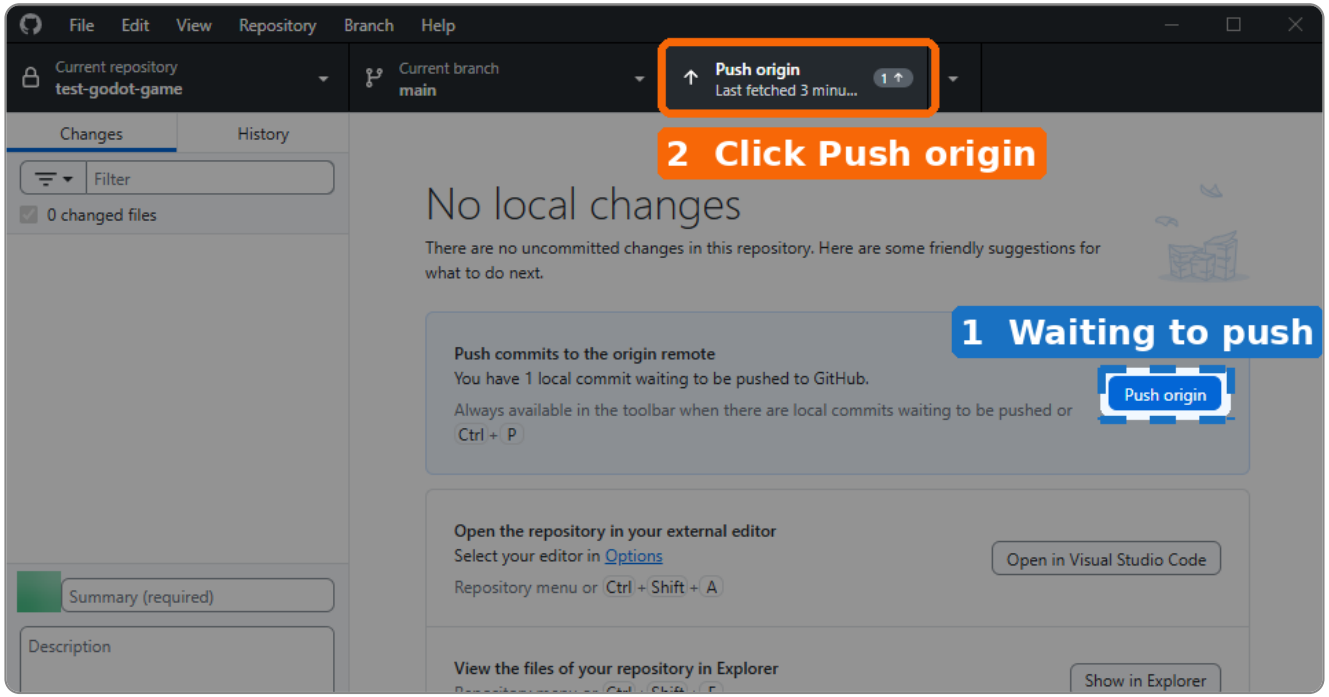

9

GitHub Desktop › Push origin

Click **Push origin**.

Commit saves a version on this computer. Push sends it to GitHub.

> **Check:** before you click, **Push origin** shows `1↑`: one commit waiting.

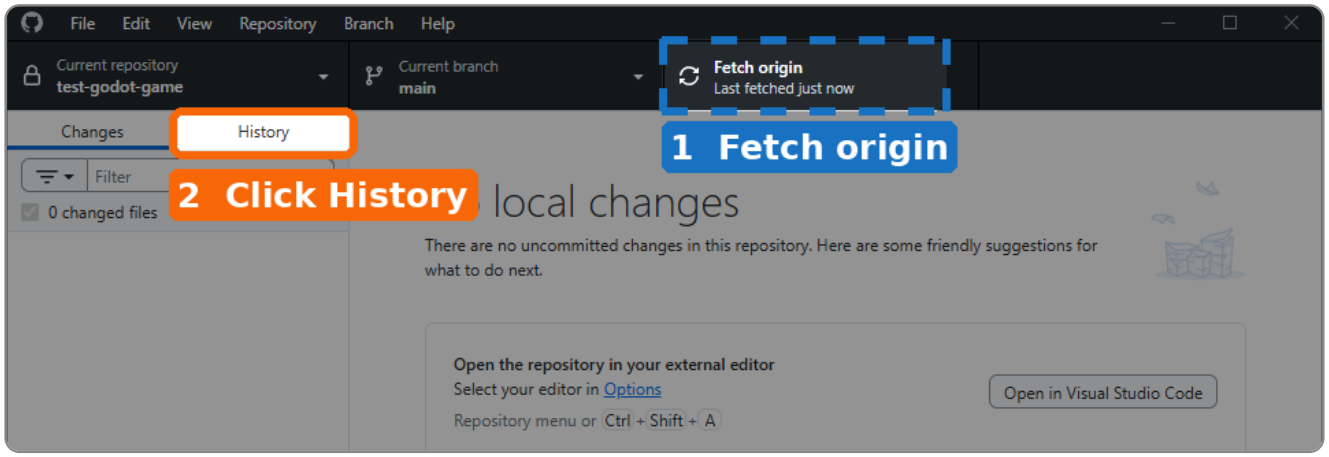

10

GitHub Desktop › Fetch origin

Check the button says **Fetch origin** again.

Click **History**.

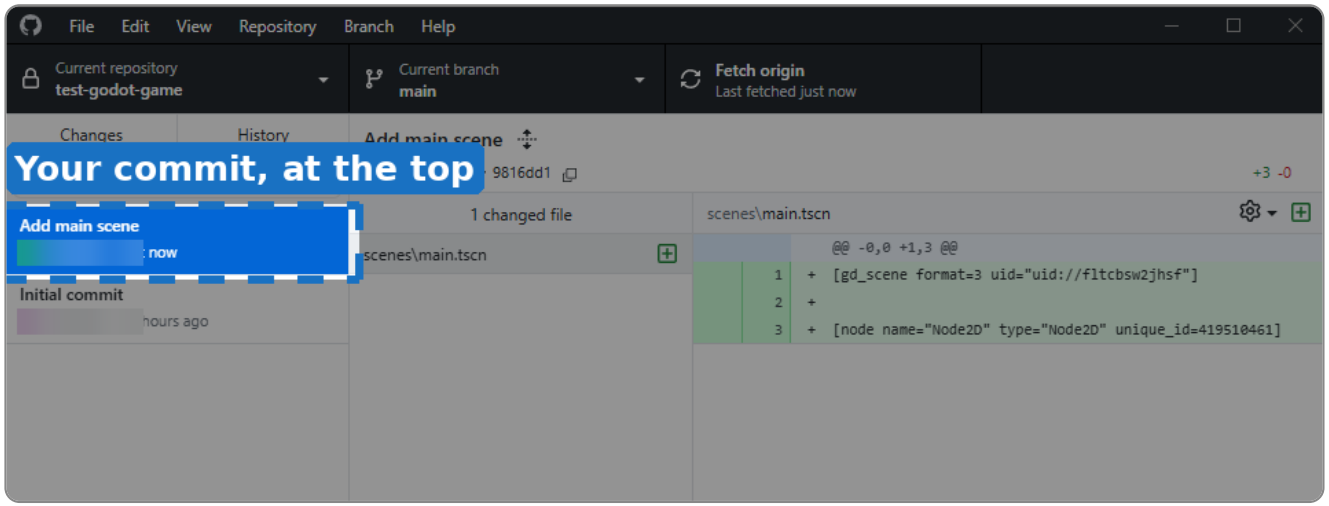

11

GitHub Desktop › History

Check your commit is at the top.

Click any commit to see what changed in it.

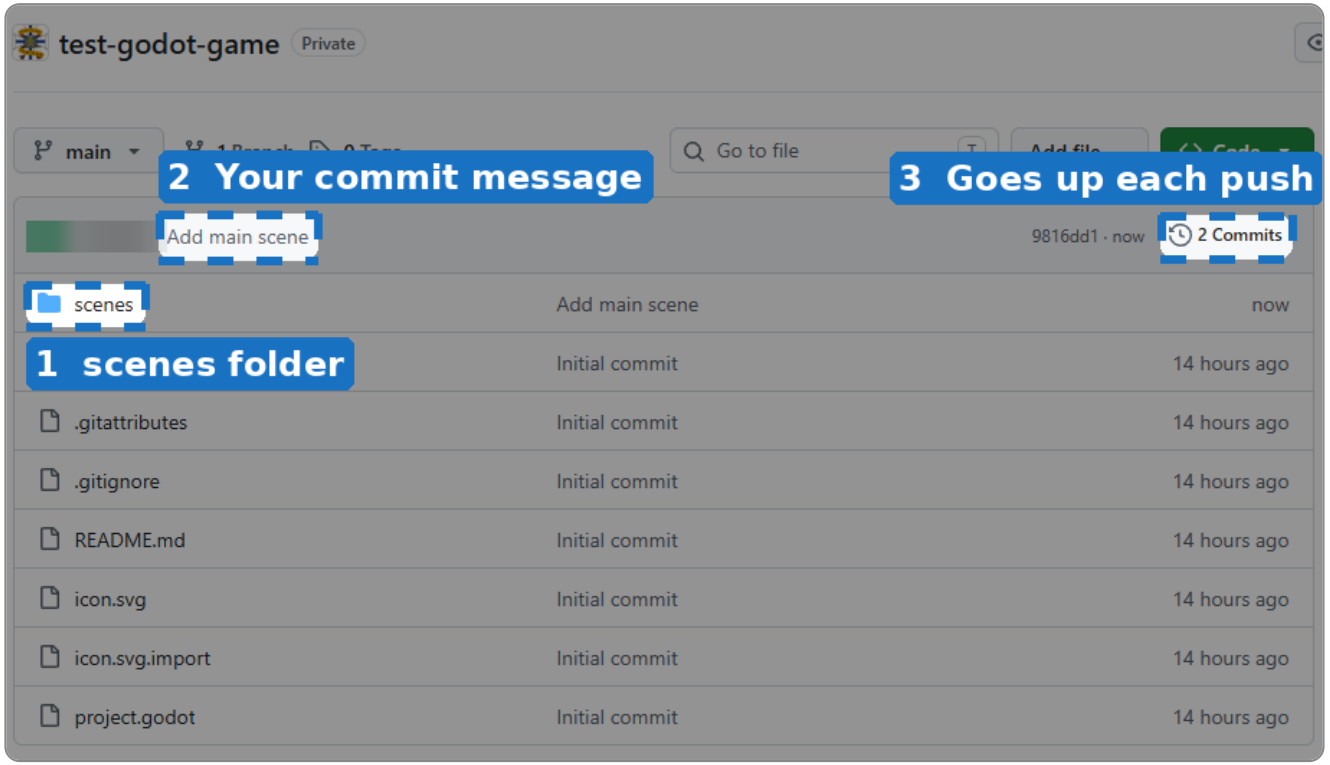

12

Chrome › GitHub › your repository

In GitHub Desktop, click **Repository › View on GitHub**.

Check you see the `scenes` folder and your commit message.

The number of commits goes up every time you push.

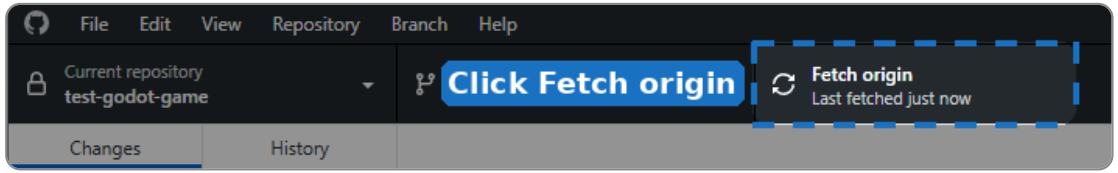

Every lesson

Save in Godot (Ctrl + S), then commit and push with GitHub Desktop before you leave. If you don't push, your work stays on this computer only.

Start of each lesson

In GitHub Desktop, click **Fetch origin**. If it changes to **Pull origin**, click it to get your latest work.

Checkpoint

- [ ] My scenes are saved in the `scenes` folder.
- [ ] I can commit with a message that says what I changed.
- [ ] I can push, and see my commit on GitHub.
