Export your game and upload it to itch.io

Digital Technologies · School and personal computers

You will

- export your Godot game for the web, into a folder for each version
- zip it and upload it to itch.io
- play your game in the browser

You need

- your Godot project, with a main scene that runs (see the guide Make a start menu)
- the Web export templates installed (see the guide Install the web export templates)
- an itch.io account, with its email confirmed

Before you start

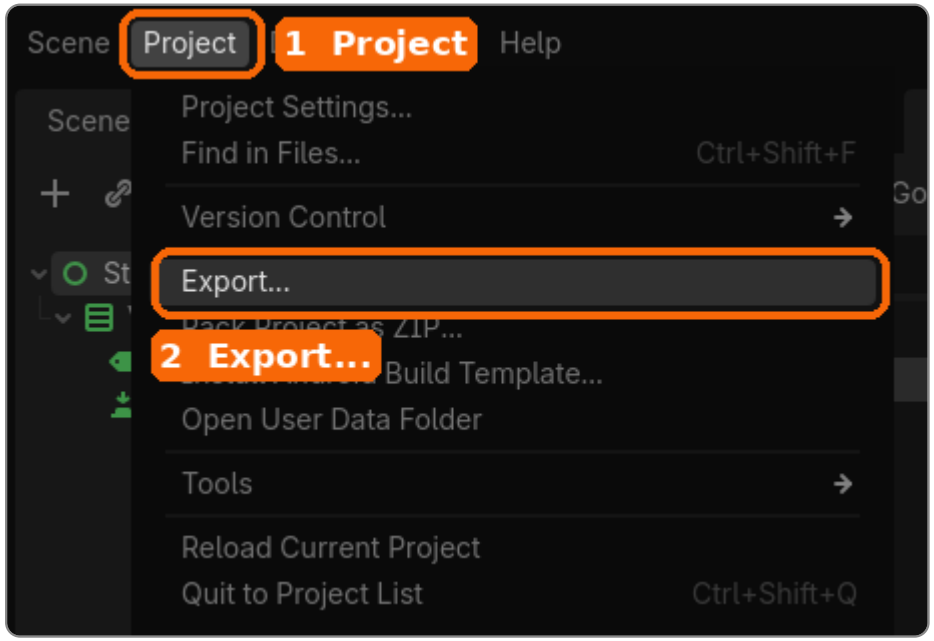

- Every export gets its own folder: `game-name-v0.1`, then `v0.2` and so on. Use `v1.0` for the version you hand in.
- Keep personal details out of your game and its page.

 Click here  Look here

1

Godot › Project menu

Click **Project** › **Export...**

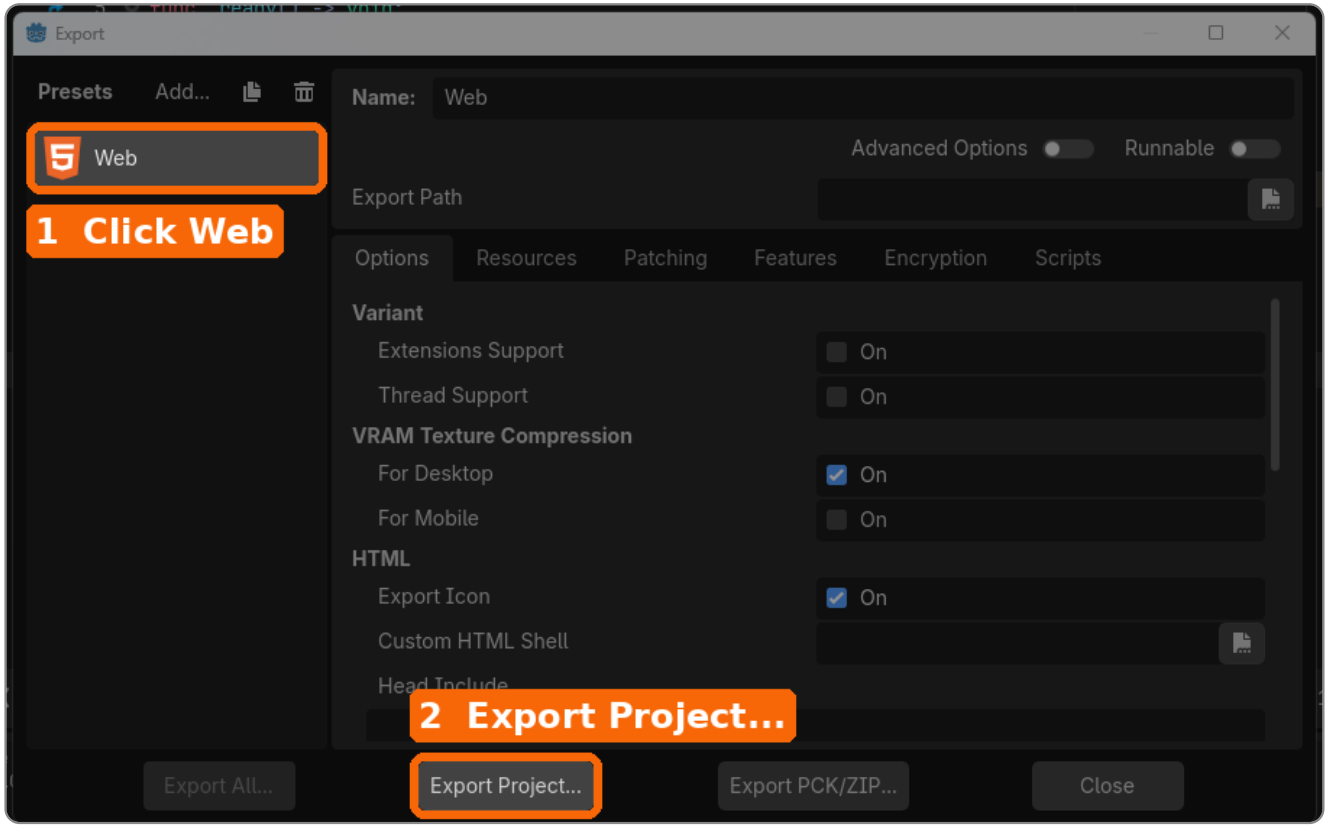

2

Godot › Export

Click **Web** in the Presets list.

Click **Export Project...**

If something goes wrong
No Web, or a red message at the bottom: see the guide Install the web export templates.

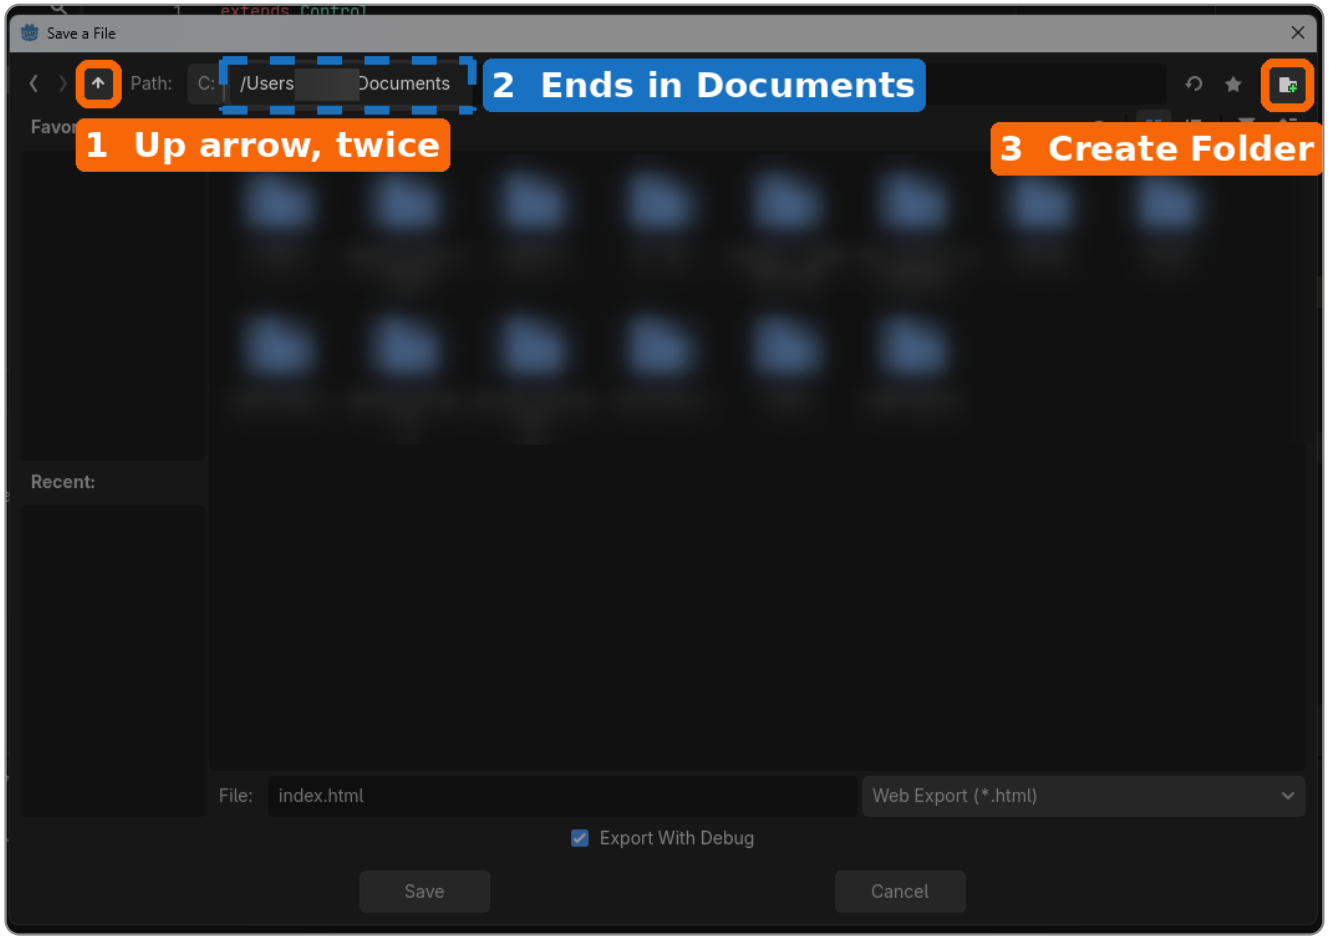

3

Godot › Save a File

Click the up arrow twice, until Path ends in Documents.

Click **Create Folder** (top right), type `Godot exports`, and click **OK**.

Godot opens the new folder. Already have a Godot exports folder? Double-click it instead.

4

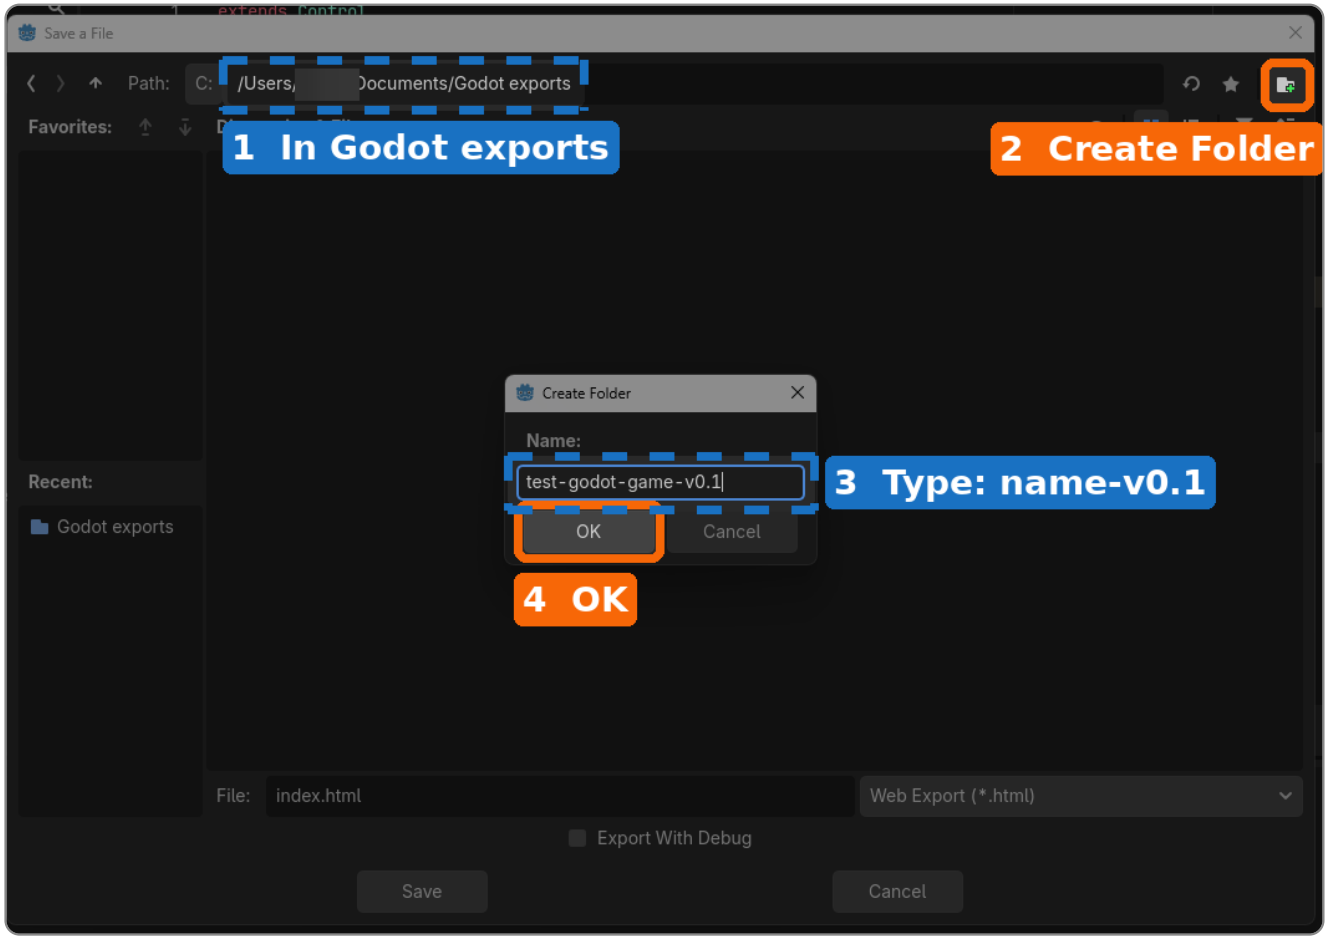

Godot › Save a File › Godot exports

Click **Create Folder** again.

Type your game's name and version, like `test-godot-game-v0.1`.

Click **OK**.

Lowercase with dashes. Each new version gets a new folder, so older versions stay safe.

5

Godot › Save a File › your version folder

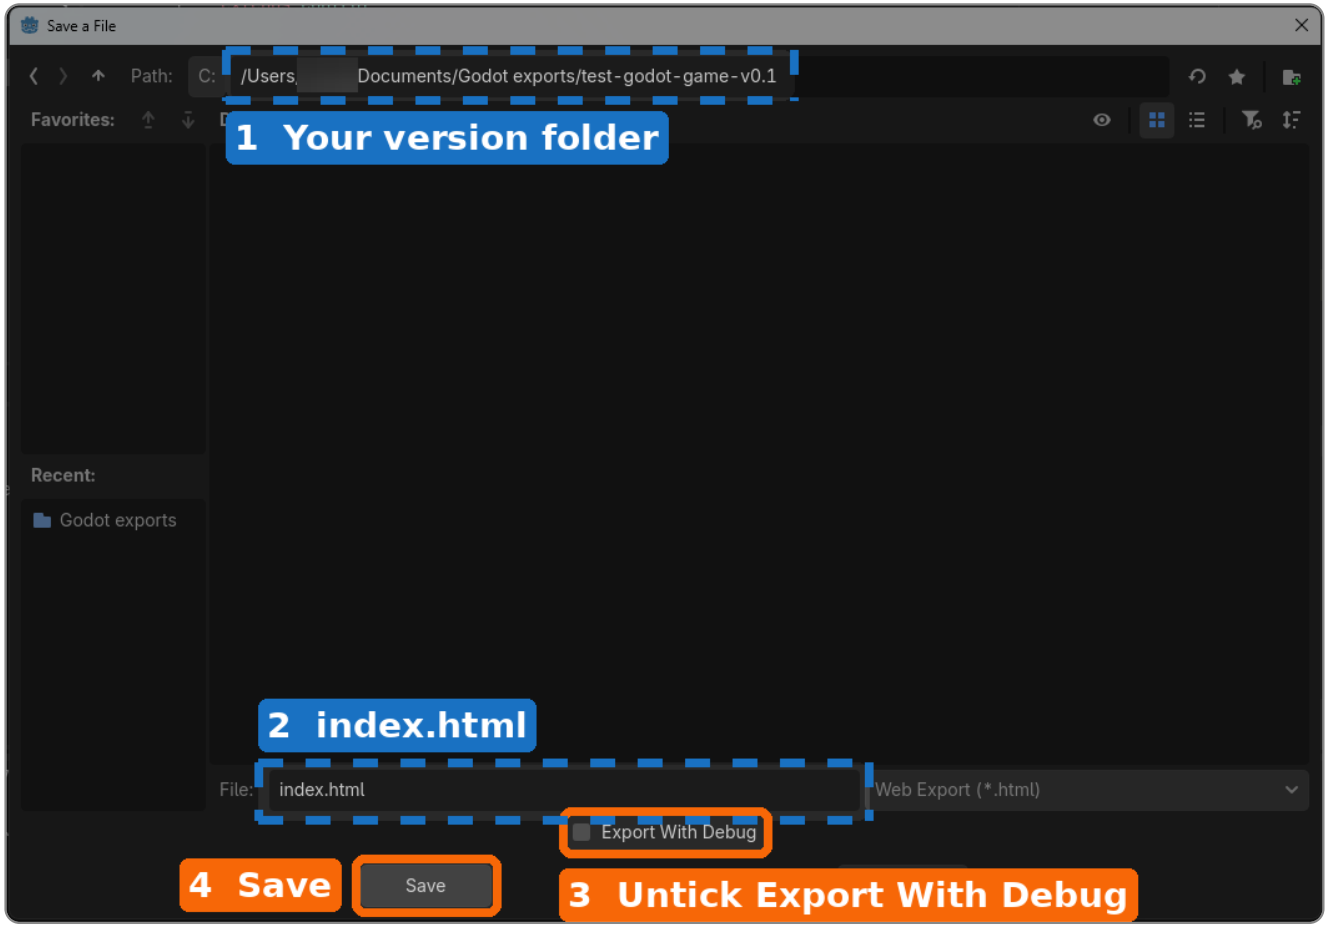

Check Path ends in your version folder, and File says `index.html`.

Untick **Export With Debug**.

Click **Save**.

Without debug, your game loads faster in the browser.

If something goes wrong
The files landed straight in Godot exports: the version folder was skipped. Delete those files, then export again into a new version folder.

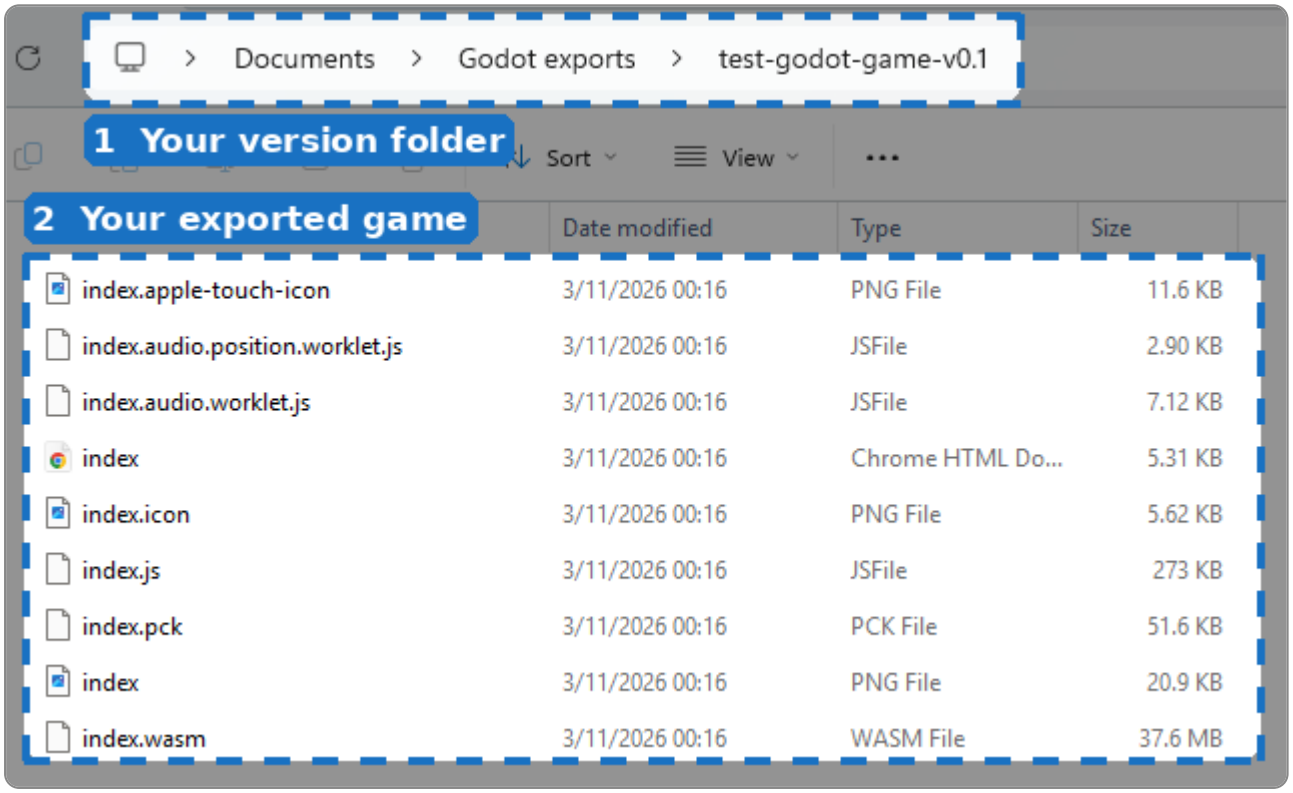

6

File Explorer › Documents › Godot exports

Open File Explorer and go to Documents › Godot exports › your version folder.

> **Check:** `index.html` and the other files Godot made.

7

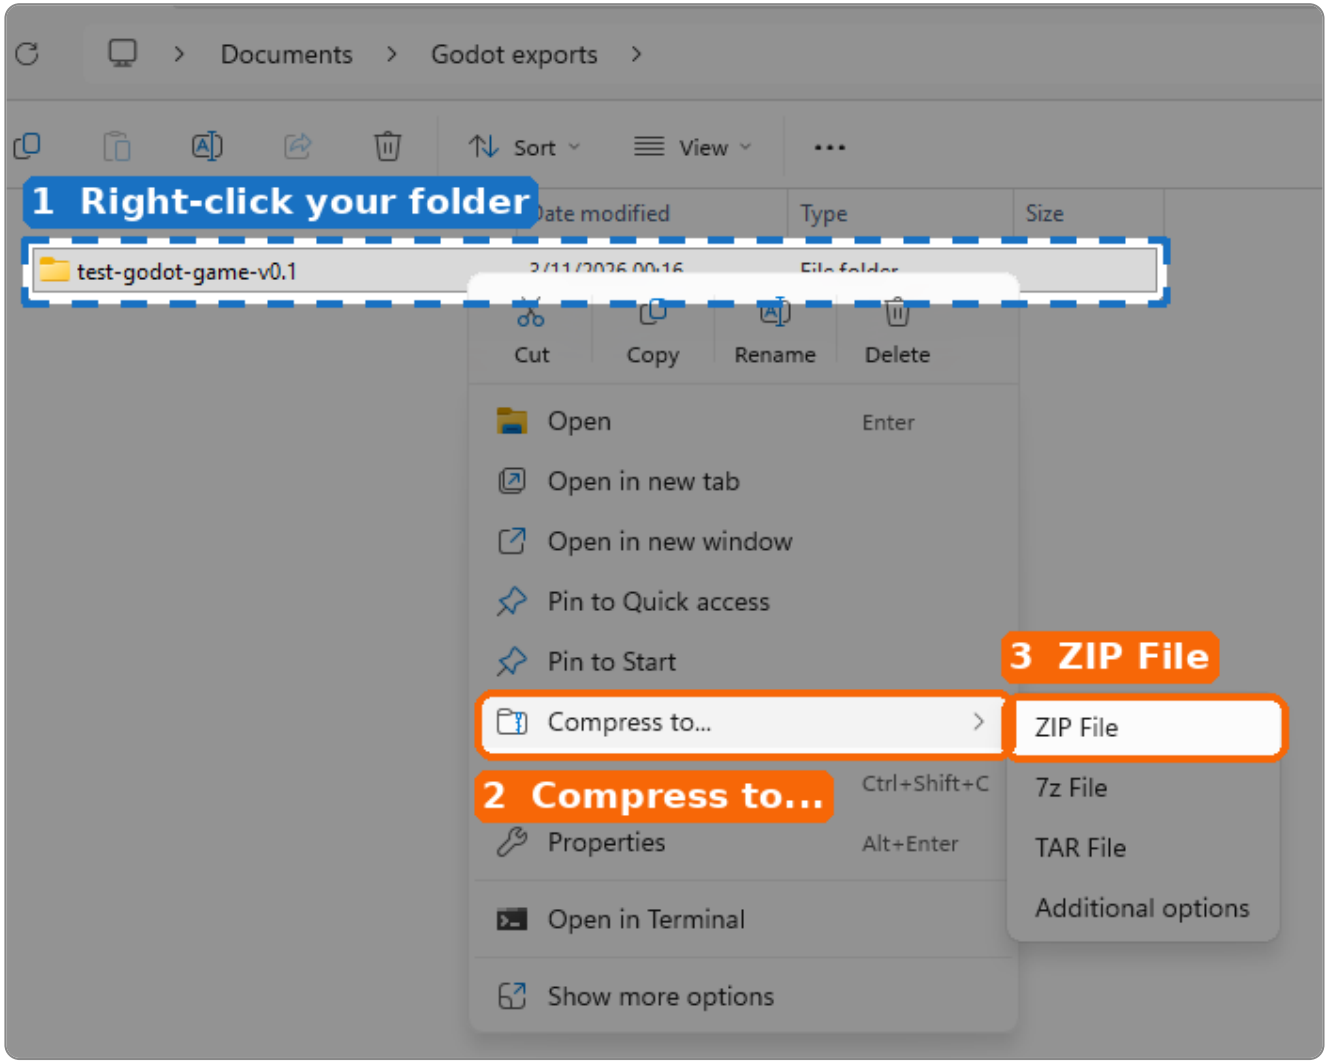

File Explorer › Documents › Godot exports

Go back up to Godot exports.

Right-click your version folder.

Click **Compress to...** › **ZIP File**.

No Compress to...? Click **Show more options** › **Send to** › **Compressed (zipped) folder**.

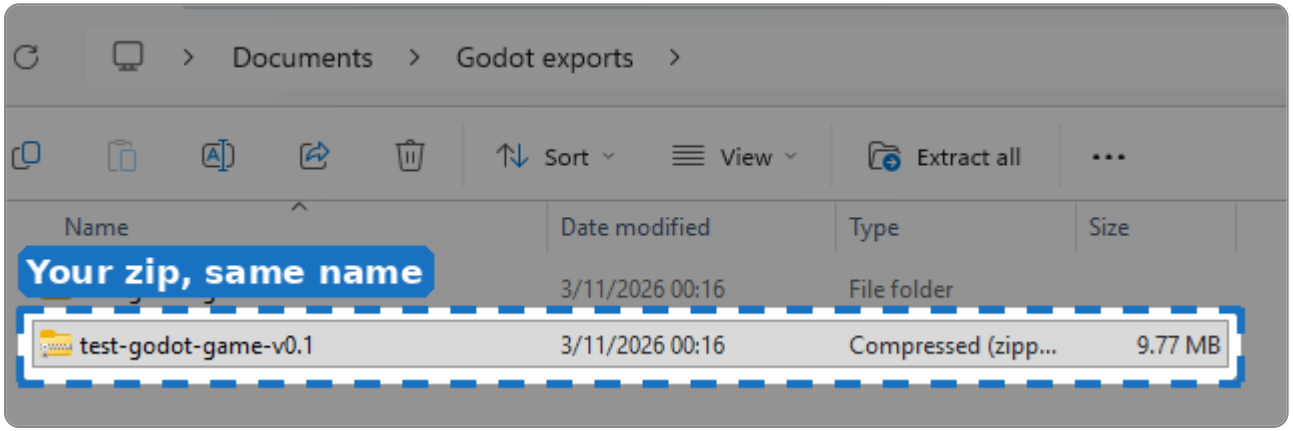

8

File Explorer › Godot exports

Leave the name as it is and press `Enter`.

> **Check:** a zip with the same name and version as your folder.

9

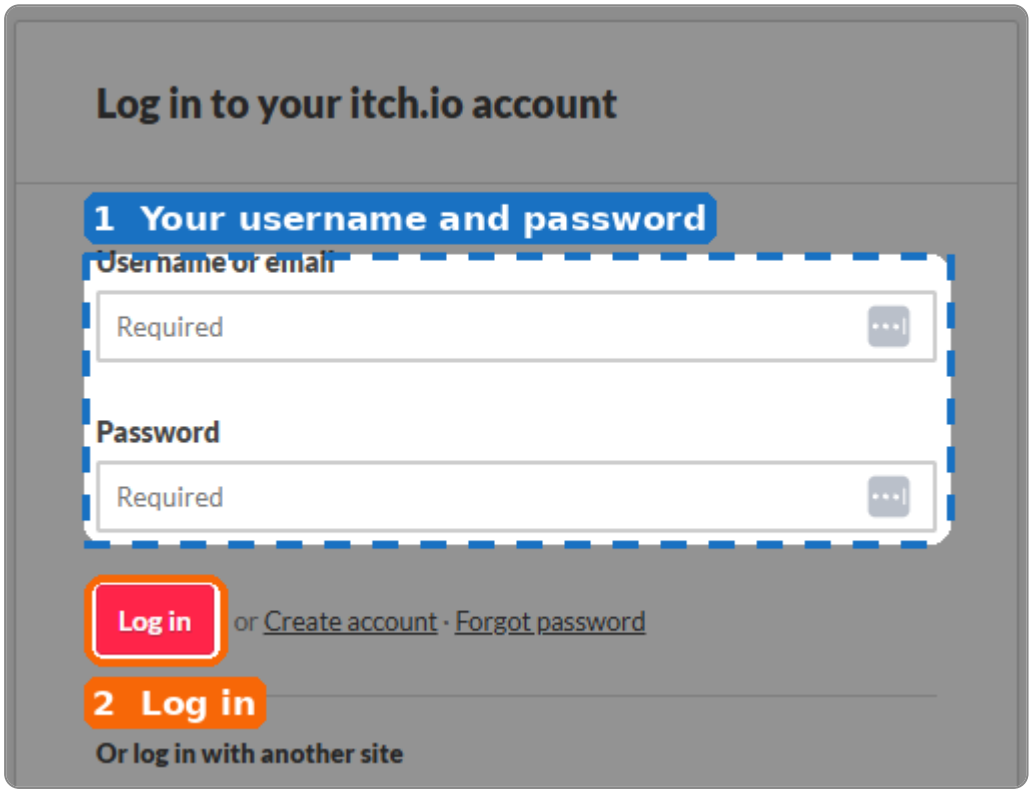

Chrome › itch.io › Log in

Go to itch.io and click Log in.

Type your username or email, and your password.

Click **Log in**.

No account yet? Click Create account, then confirm your email before you upload.

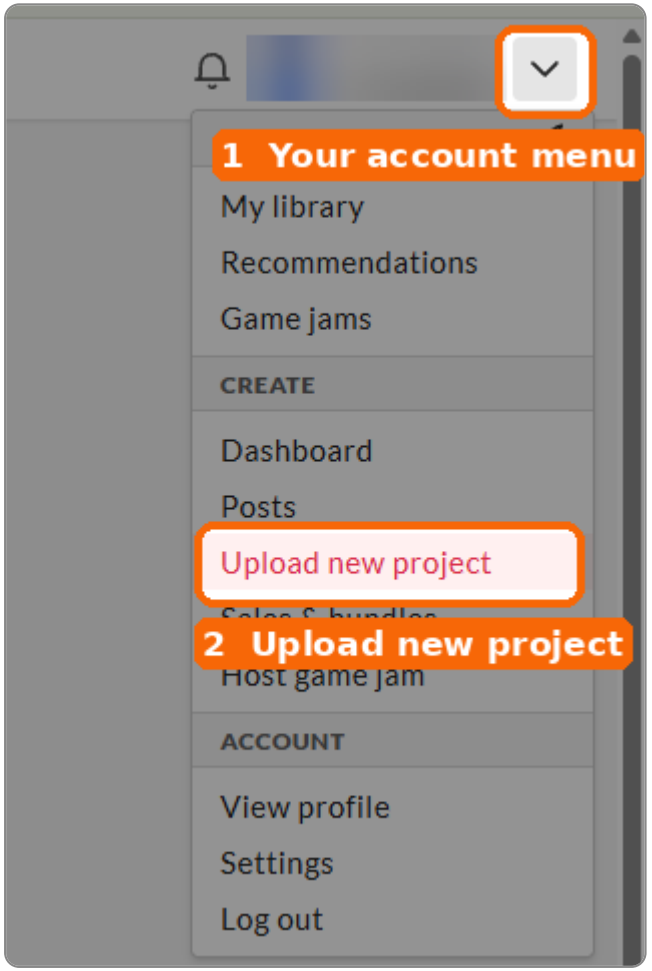

10

Chrome › itch.io

Click the arrow next to your name (top right).

Click **Upload new project**.

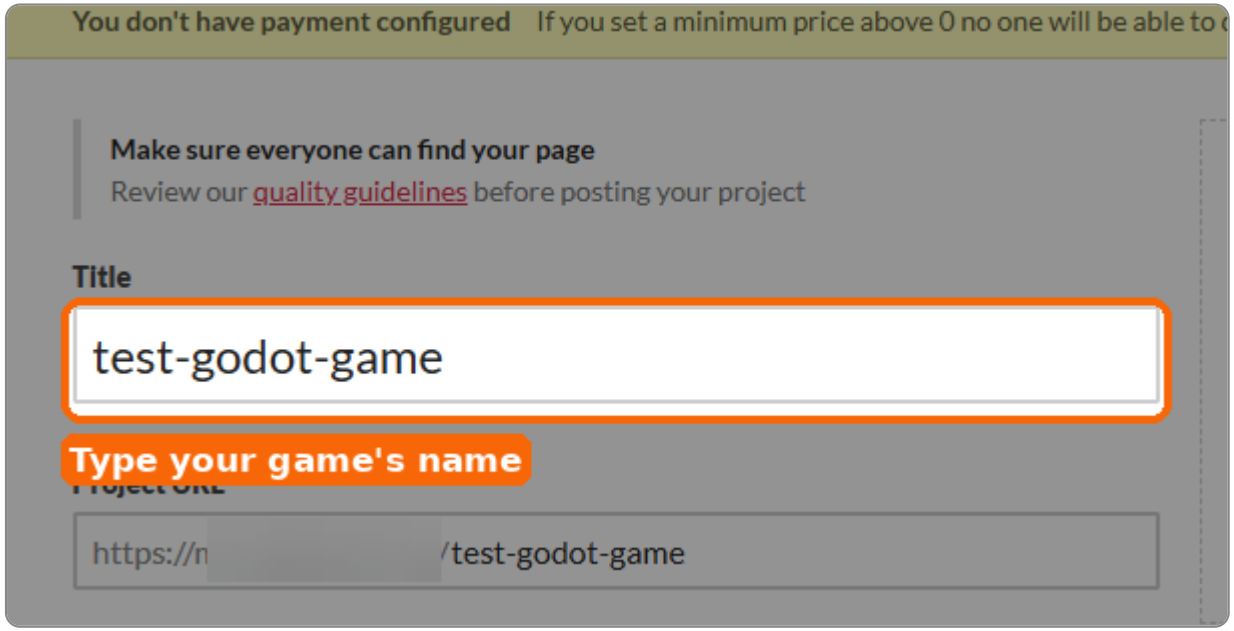

11

Chrome › itch.io › Create a new project

Type your game's name in **Title**.

The Project URL fills itself in from the title.

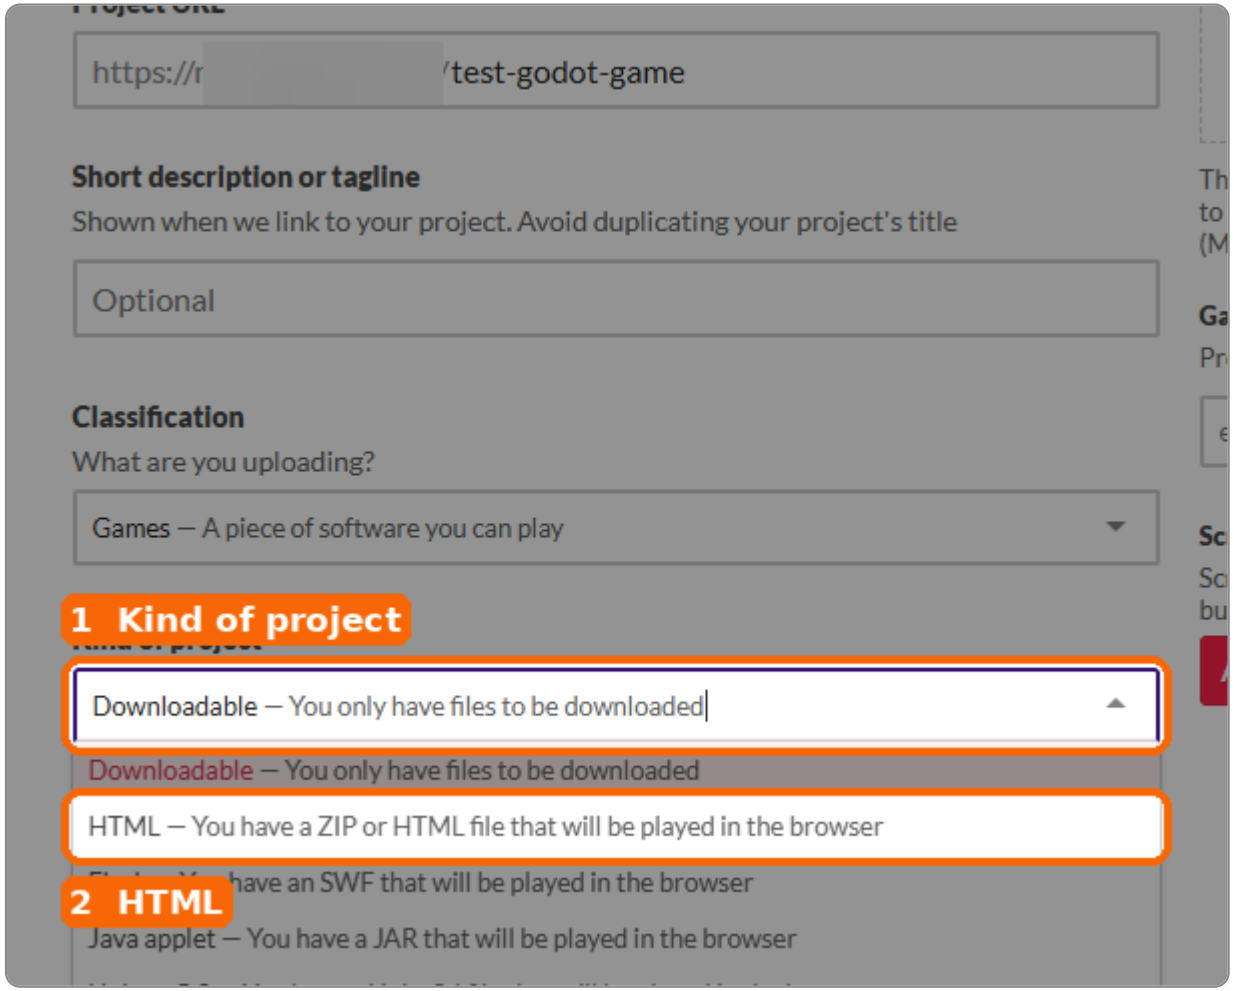

12

Chrome › itch.io › Create a new project

Scroll down.

Click **Kind of project**, then **HTML**.

HTML means the game plays in the browser.

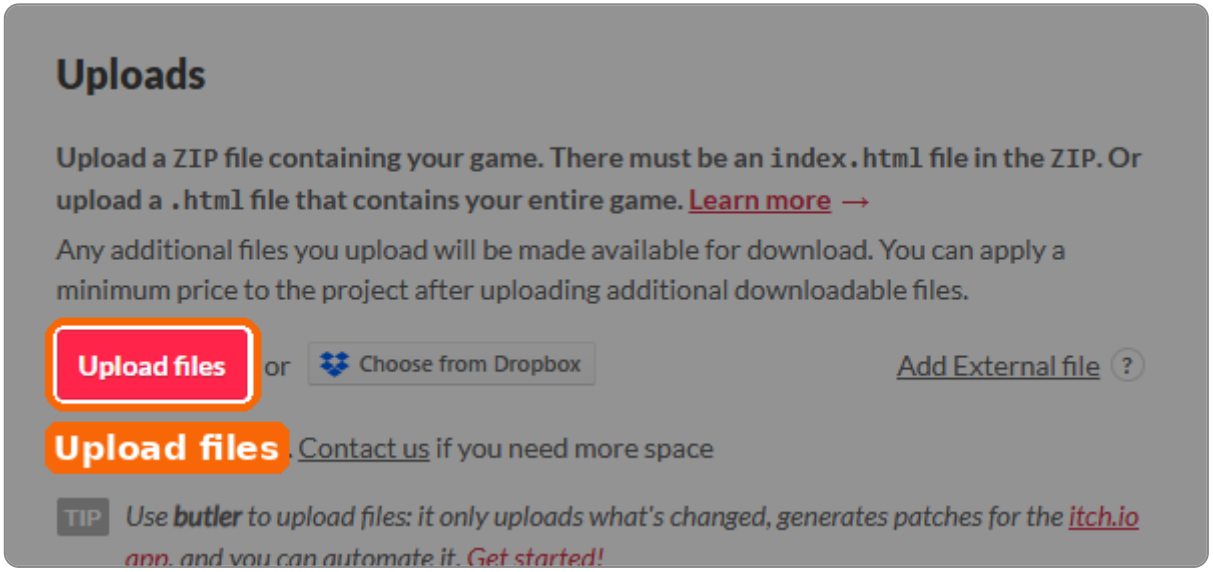

13

Chrome › itch.io › Uploads

Scroll down to **Uploads**.

Click **Upload files**.

14

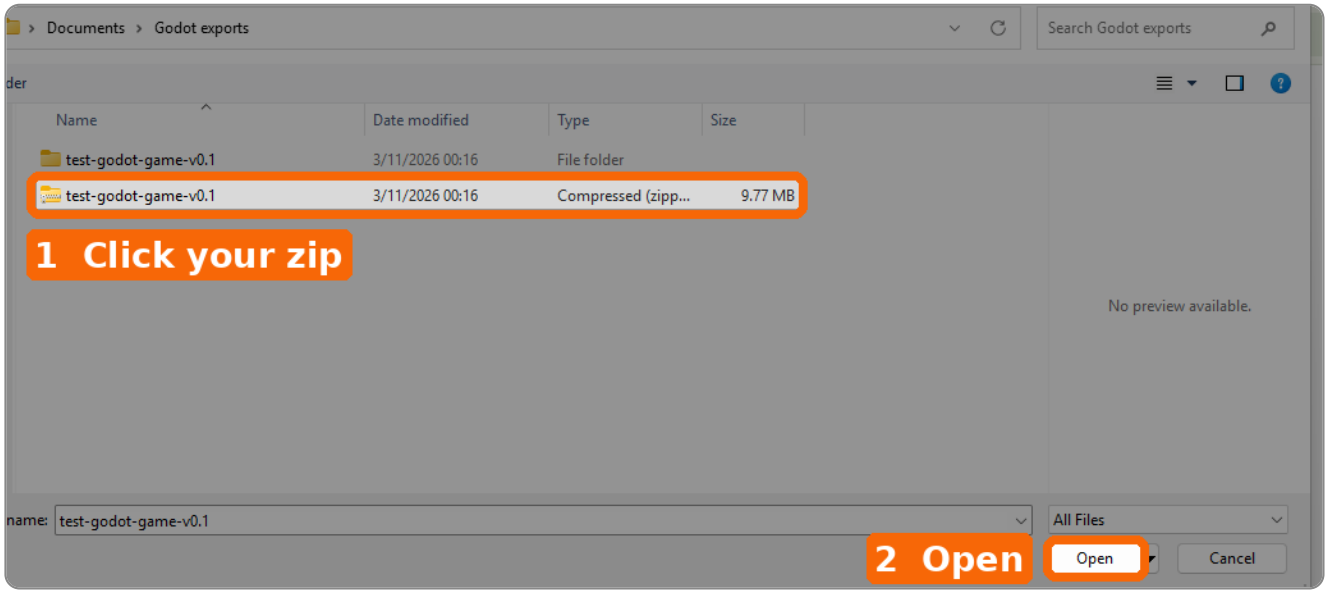

Chrome › Open

Go to Documents › Godot exports.

Click your zip.

Click **Open**.

Pick the zip, not the folder next to it.

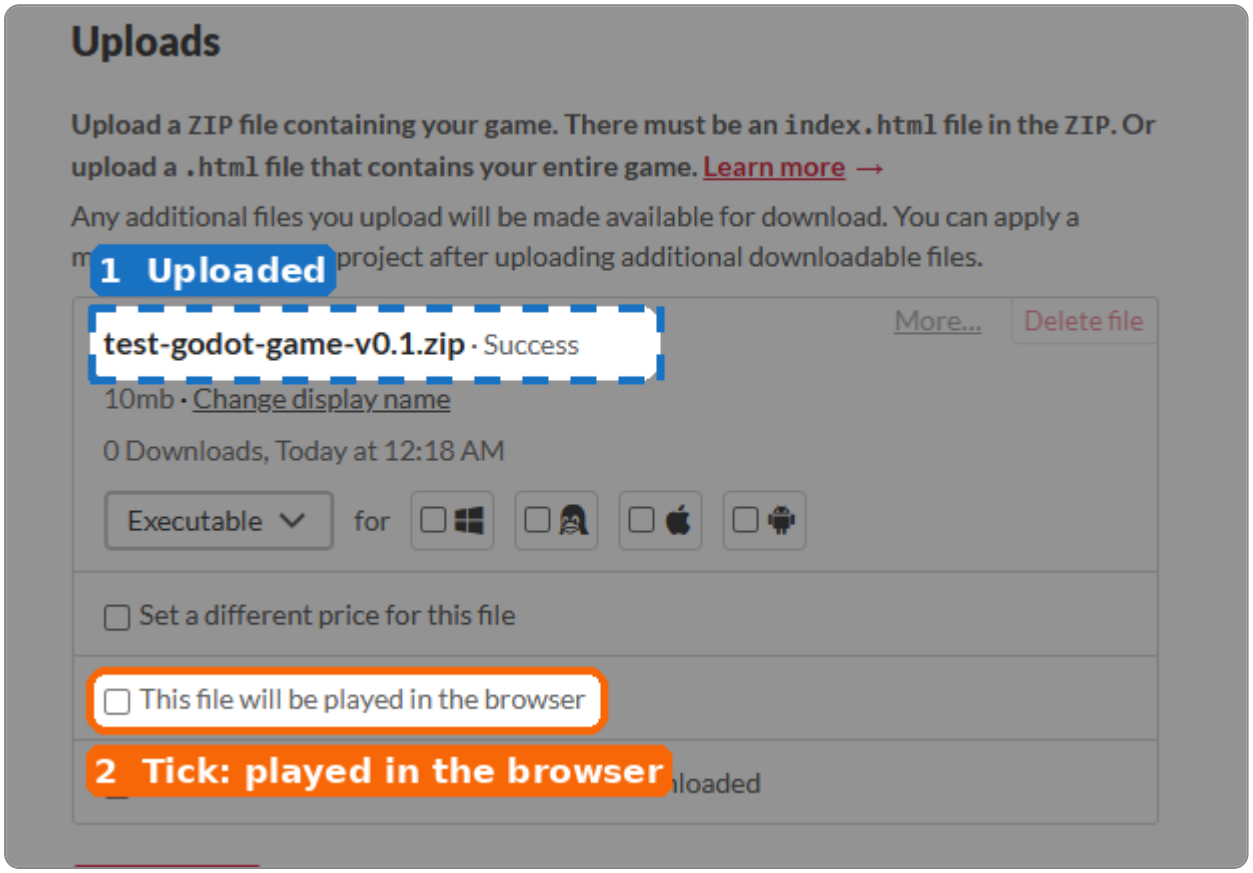

15

Chrome › itch.io › Uploads

Wait until your zip says Success.

Tick **This file will be played in the browser**.

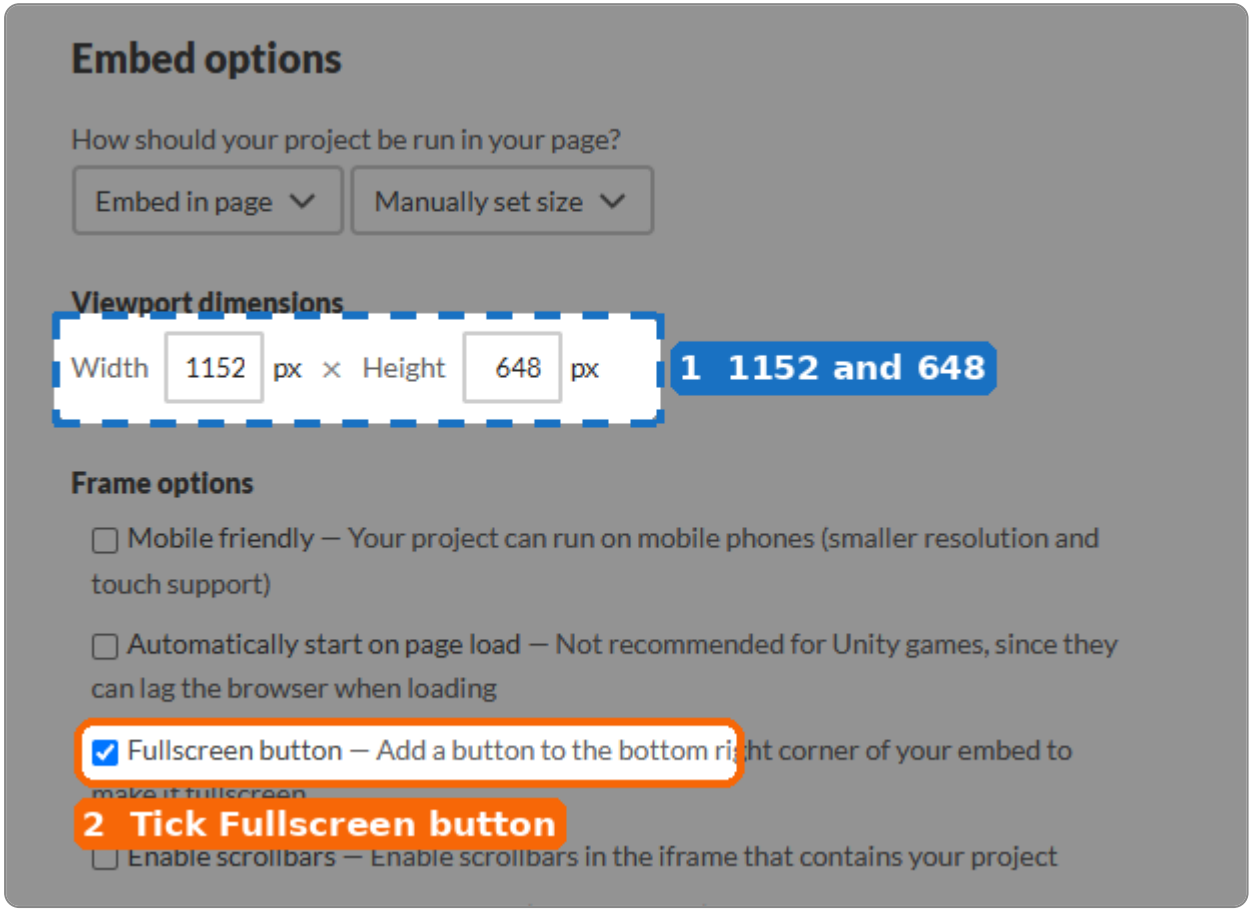

16

Chrome › itch.io › Embed options

Under **Viewport dimensions**, type `1152` and `648`.

Tick **Fullscreen button**.

1152 × 648 is the size of Godot's game window, so nothing gets cut off.

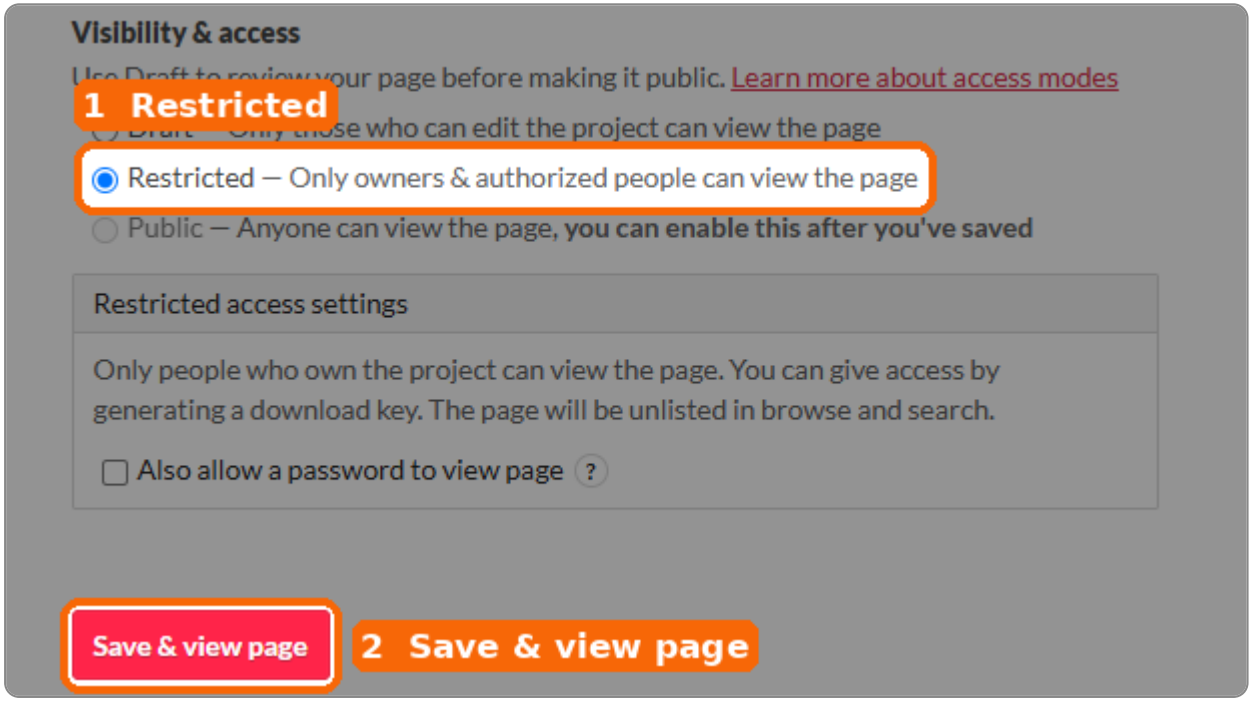

17

Chrome › itch.io › Visibility & access

Scroll to the bottom and choose **Restricted**.

Click **Save & view page**.

Restricted keeps your page private. To let your class play, tick Also allow a password to view page and share the password. Further up, answer AI generation disclosure honestly.

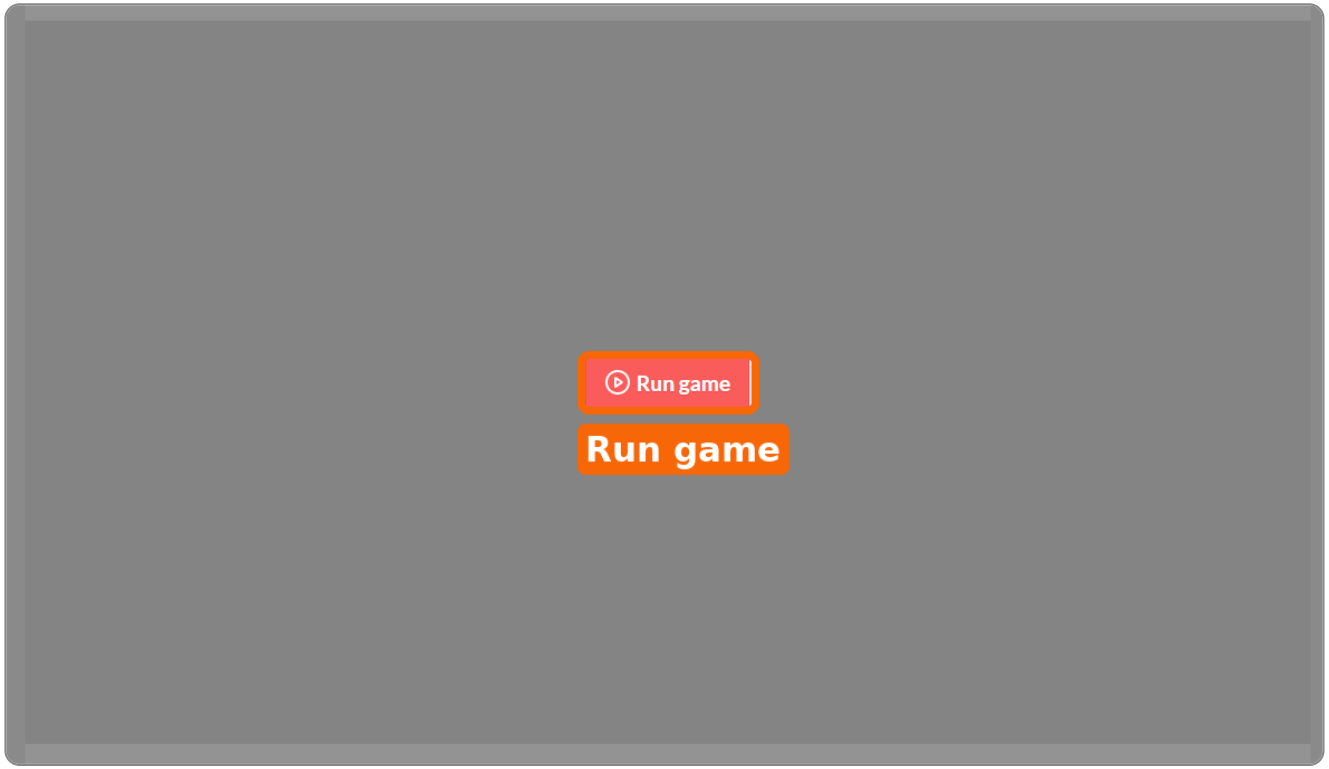

18

Chrome › Your game's page

Click **Run game**.

The first load can take a moment.

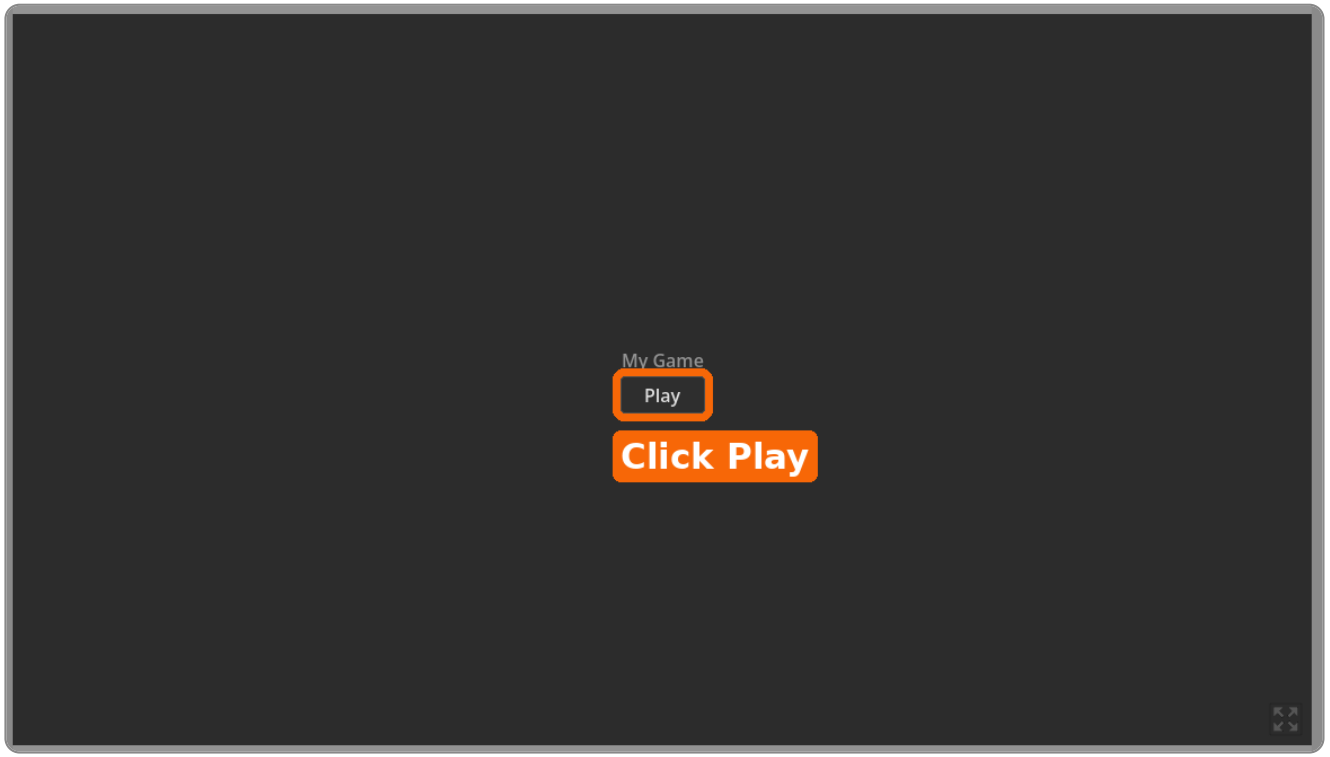

19

Chrome › Your game's page

Wait for the Godot logo to finish.

Click **Play** (or whatever your first button is).

> **Check:** your start menu shows in the browser.

20

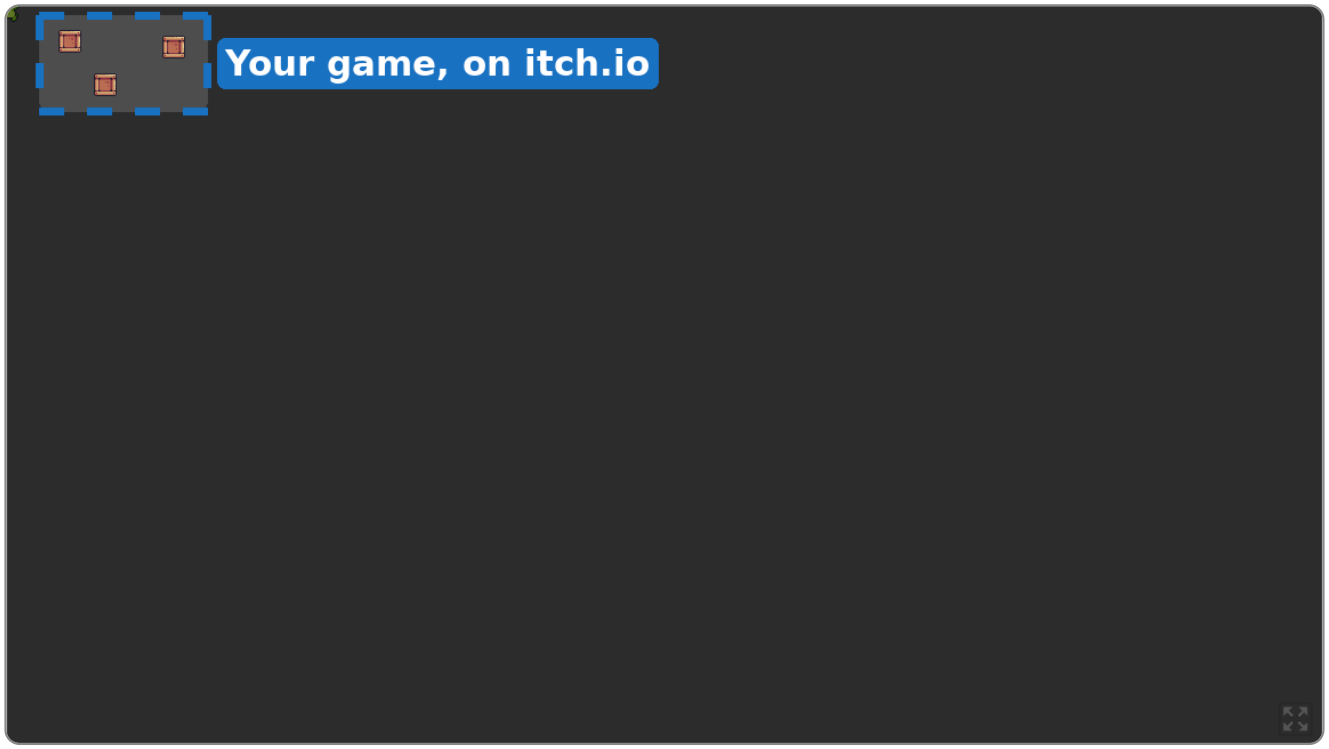

Chrome › Your game's page

Play your game to check it works.

> **Check:** your game runs in the browser, just like in Godot.

If something goes wrong

A grey or black screen: check Kind of project is HTML and the zip is ticked as played in the browser. Then check your game runs with F5 in Godot.

Version numbers
`v0.1`, `v0.2`… while you build and test. `v1.0` for the version you hand in. `v1.1`, `v1.2`… for changes after that. Use the same number in the folder, the zip and your commit message.

Upload a new version
Export into a new version folder and zip it. On itch.io click Edit game, click Delete file on the old zip, upload the new one, tick This file will be played in the browser, then Save.

If your project is on GitHub
Commit and push with GitHub Desktop, as usual. The Web preset is saved in `export_presets.cfg`. The exported files stay out of GitHub.

Checkpoint

- [ ] I can export my game into a version folder.
- [ ] I can zip it and upload it to itch.io.
- [ ] My game plays in the browser.
