Get your Godot project on another computer

Digital Technologies · School computers

You will

- copy your project from GitHub onto this computer
- open it in Godot and carry on working

You need

- your project already on GitHub (see the guide Put a Godot project on GitHub)
- GitHub Desktop signed in (the same guide shows how)
- Godot on this computer, in `Documents` › `Godot` (see the guide Download Godot)

Before you start

- Use this when you're on a computer that doesn't have your project yet.
- Your project is already on this computer? You don't need this guide. In GitHub Desktop, click Fetch origin, then Pull origin if it appears.

 Click here  Look here

1

GitHub Desktop › Let's get started!

Click **Clone a repository from the Internet...**

If something goes wrong
You don't see Let's get started!:
click **File** › **Clone repository...** instead.

2

GitHub Desktop › Clone a repository

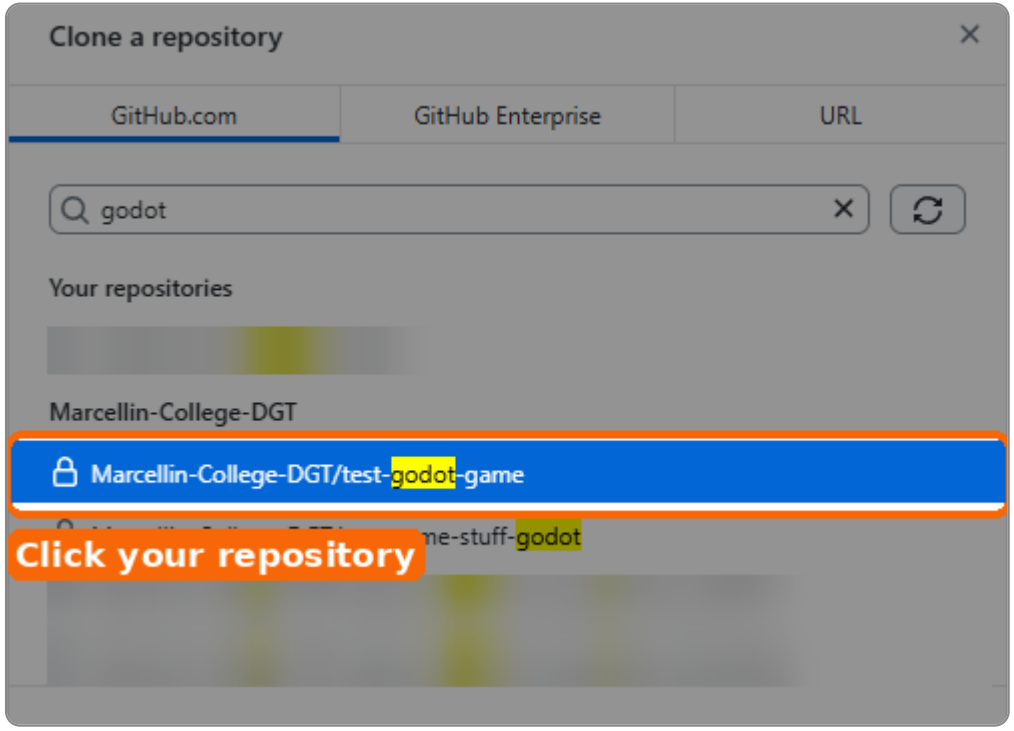

In the filter box, type part of your game's name.

Under **Marcellin-College-DGT**, click your repository.

Check **Local path** ends in `Documents\GitHub\` and your game's name.

If it doesn't, do the next step. If it does, skip it.

If something goes wrong
Your repository isn't listed: check you're signed in to GitHub Desktop with your school GitHub account.

3

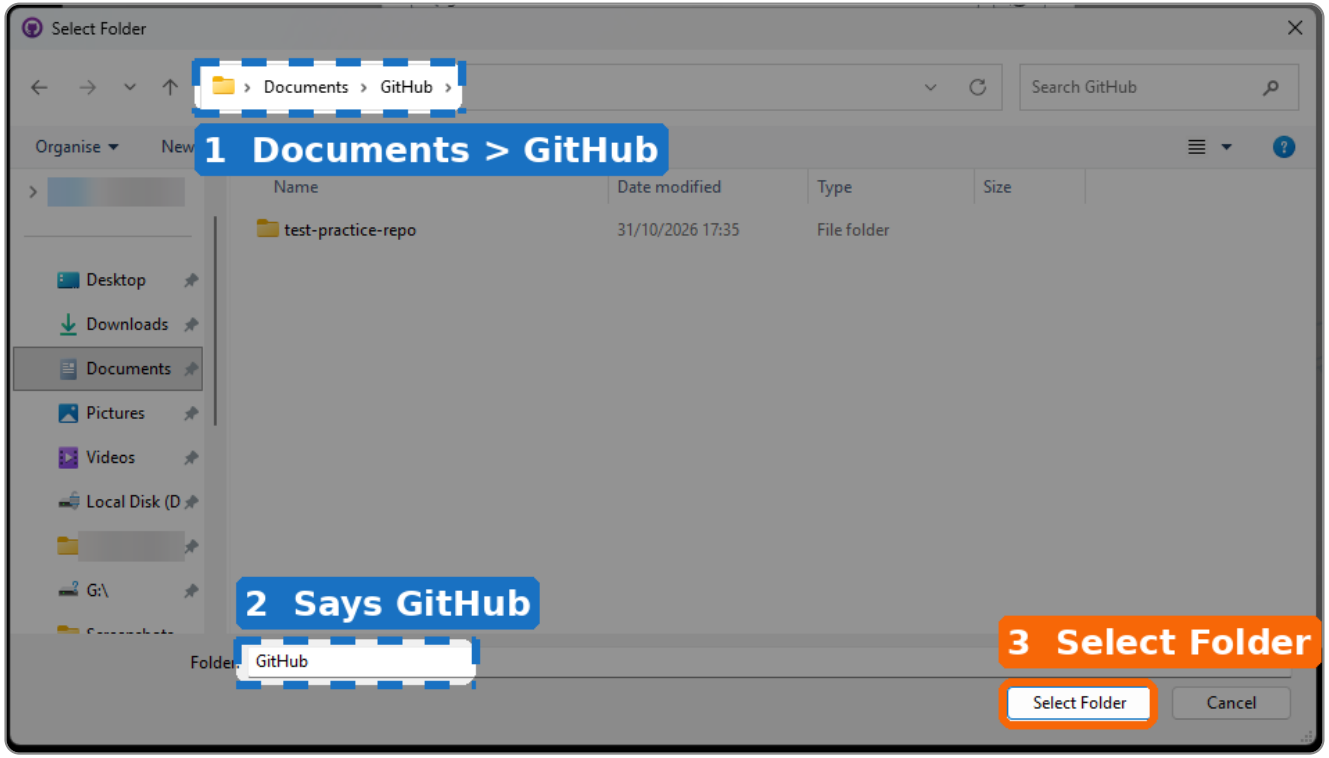

Windows › Select Folder

Click **Choose...** next to **Local path**.

Open `Documents` › `GitHub`.

Click **Select Folder**.

Choose the GitHub folder itself. GitHub Desktop adds your game's folder inside it.

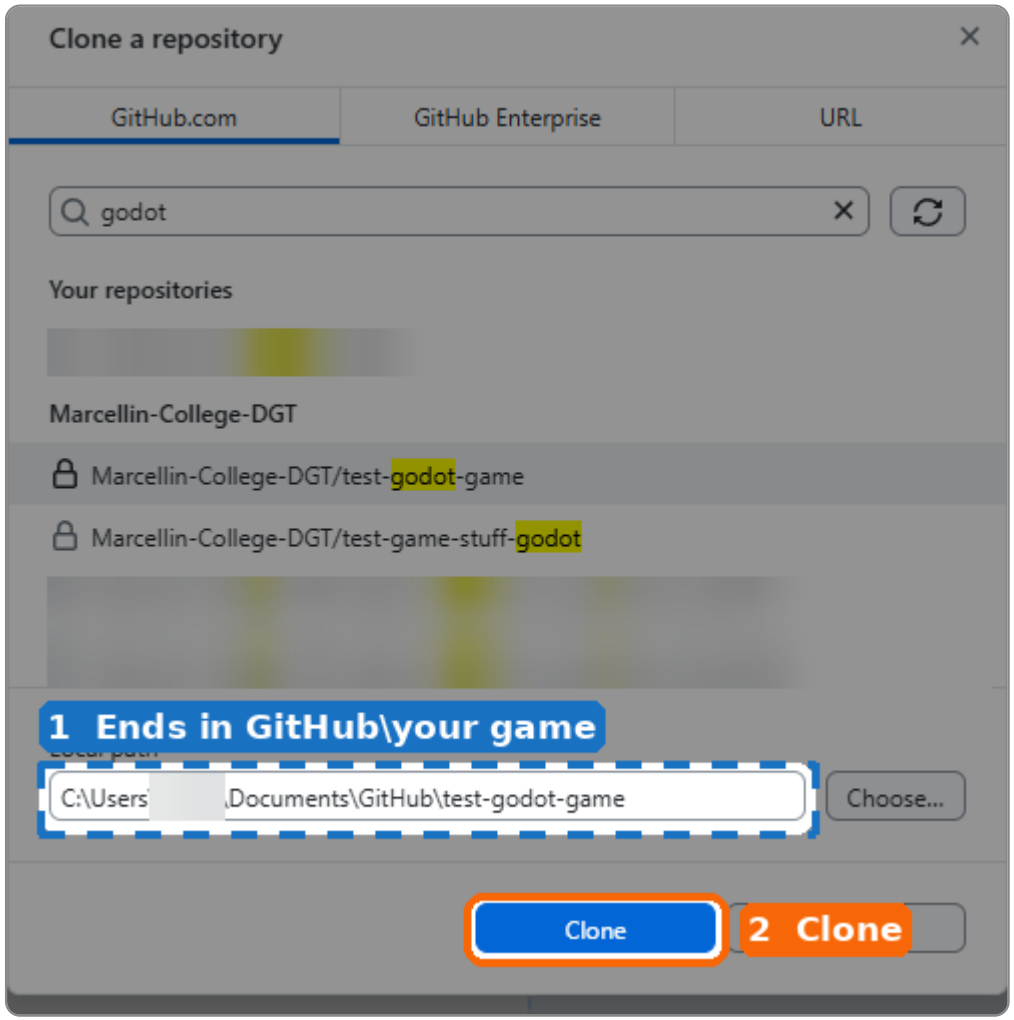

4

GitHub Desktop › Clone a repository

Check **Local path** again.

Click **Clone**.

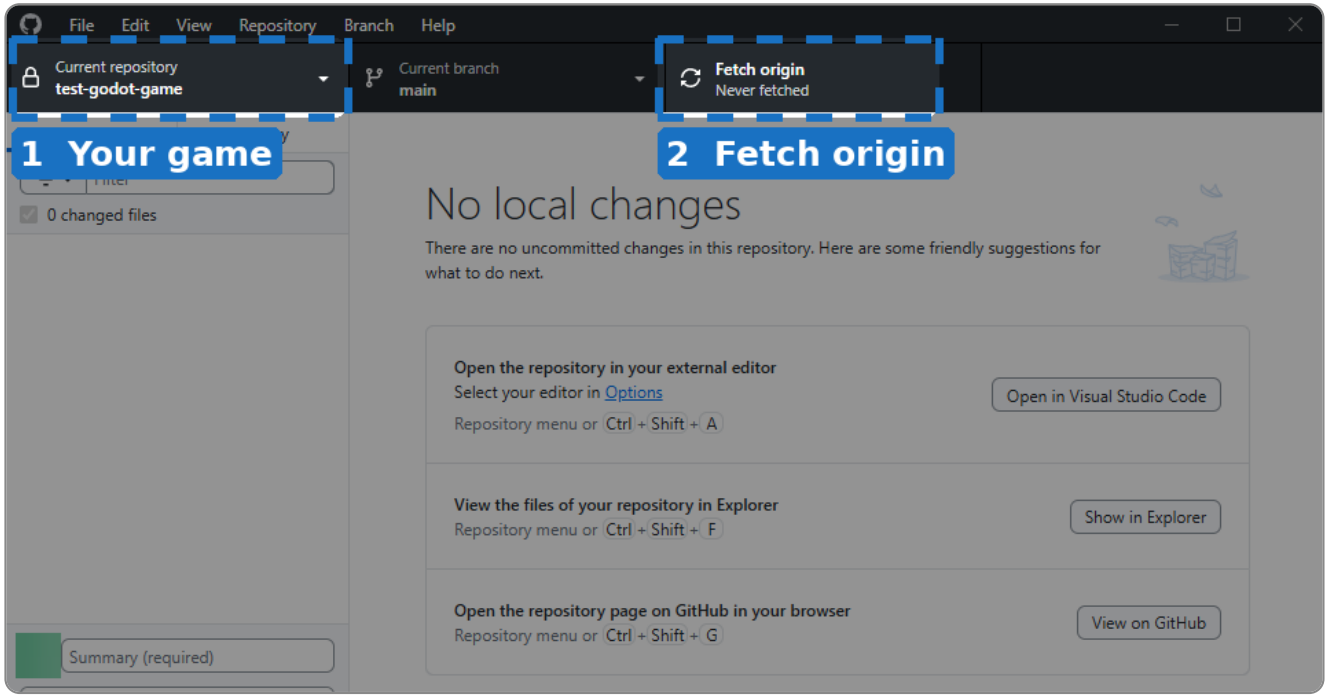

5

GitHub Desktop › Your repository

Wait while GitHub Desktop copies your project.

Check **Current repository** shows your game.

> **Check:** the top button says **Fetch origin**.

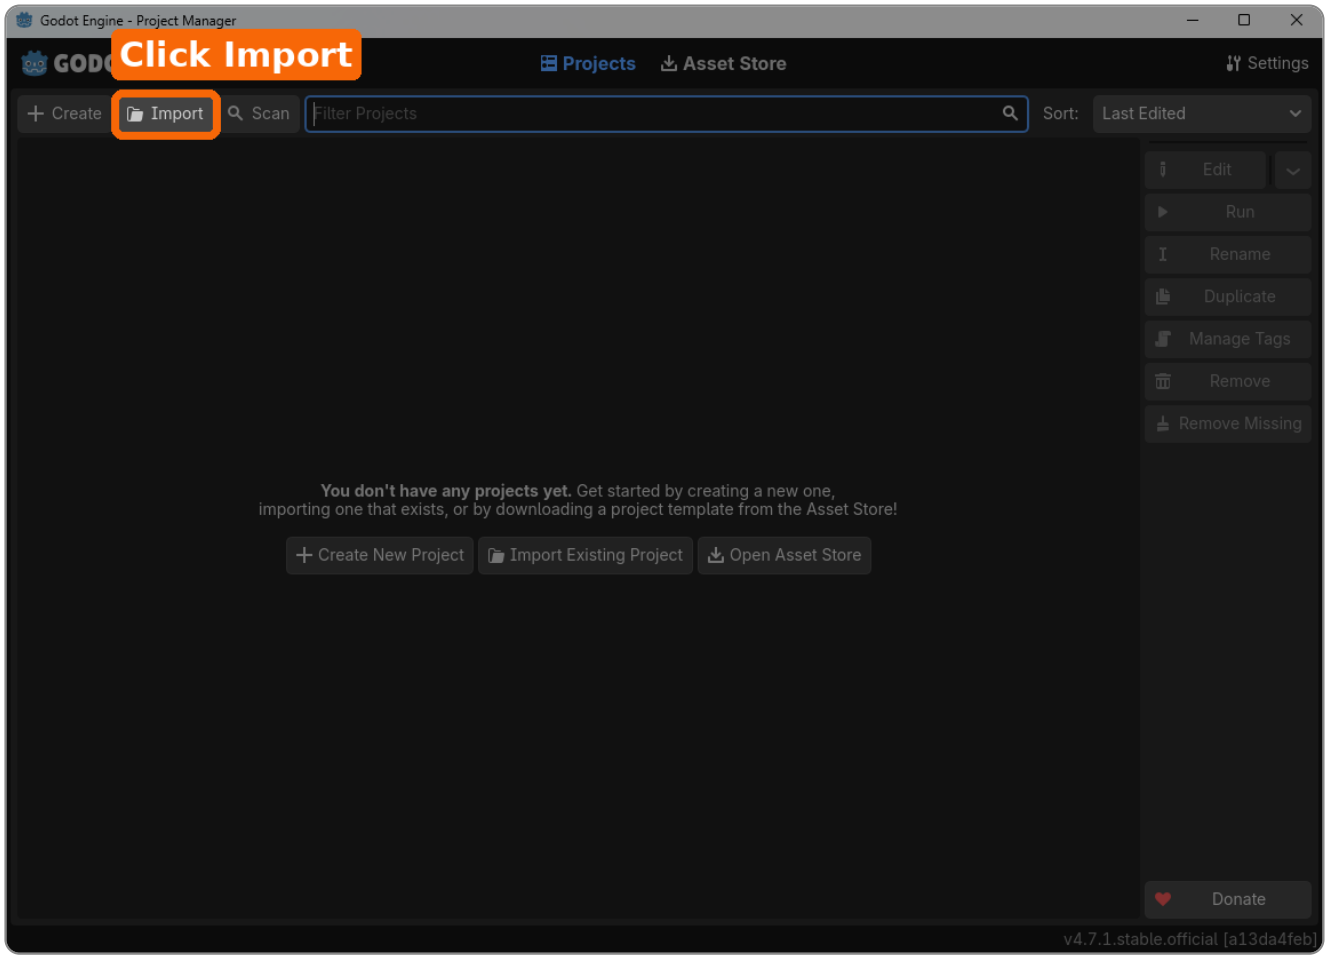

6

Godot › Project Manager

Open Godot.

Click **Import**.

Godot doesn't know about your project on this computer yet, so you import it once.

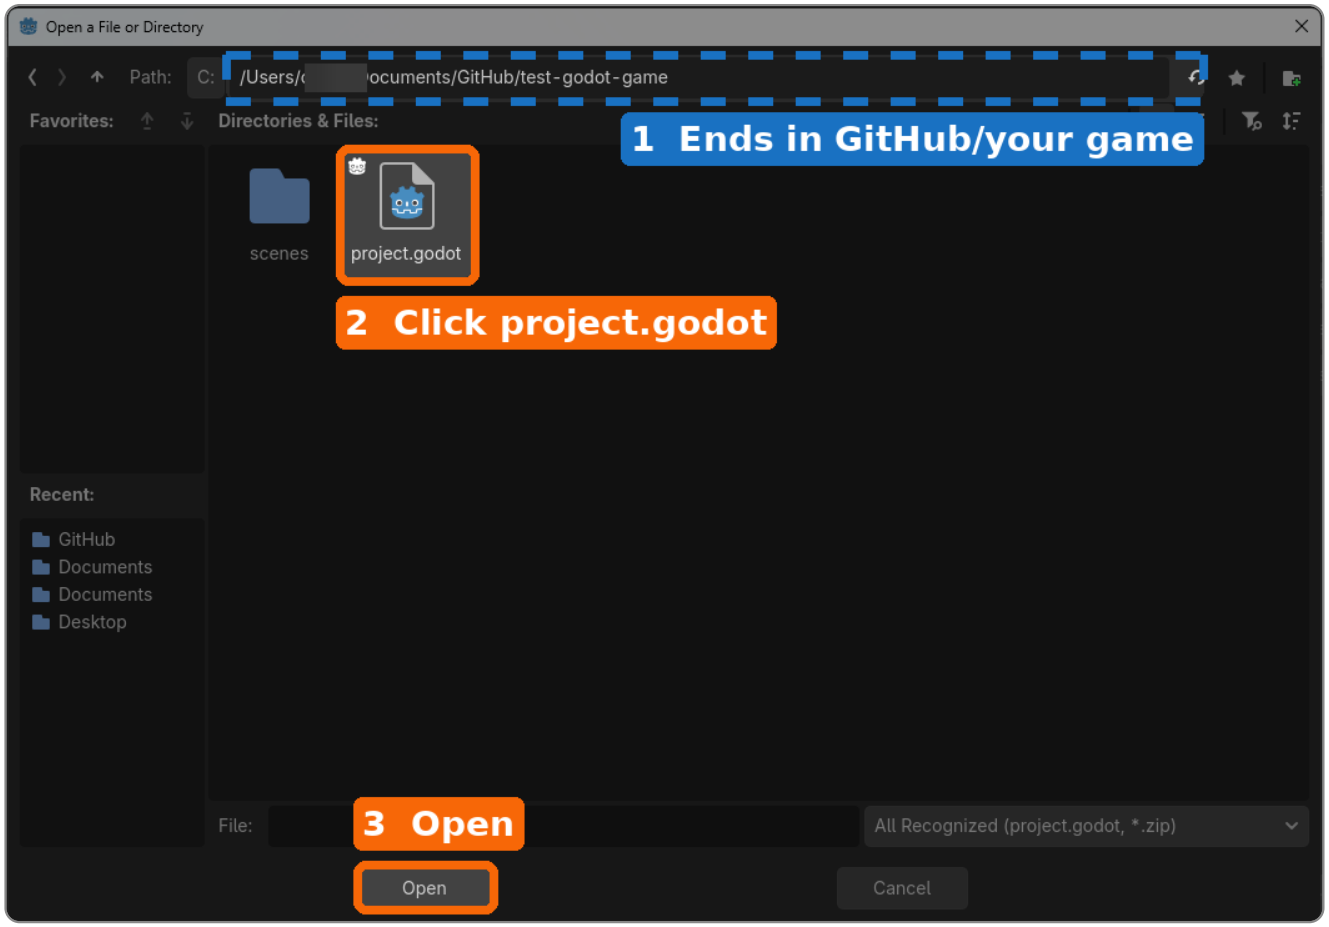

7

Godot › Open a File or Directory

Go to `Documents` › `GitHub` and double-click your game's folder.

Click `project.godot`.

Click **Open**.

8

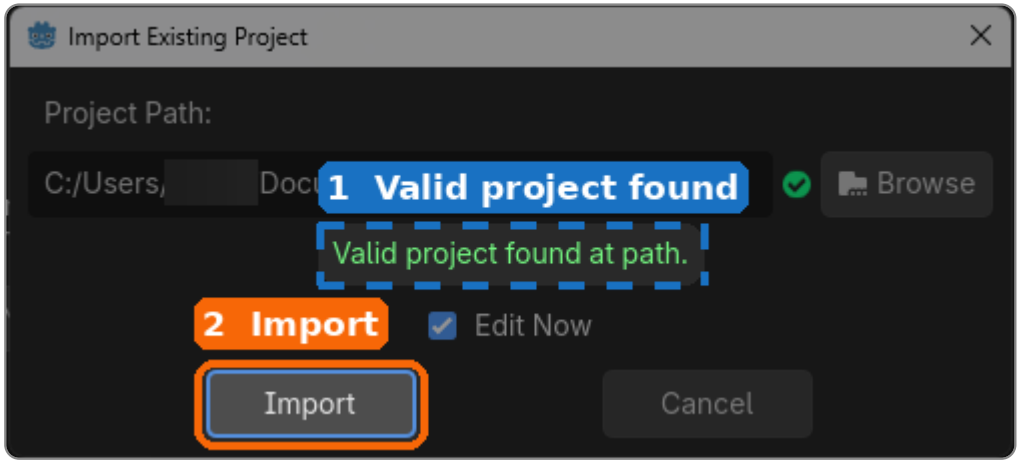

Godot › Import Existing Project

Check it says **Valid project found at path.**

Leave **Edit Now** ticked.

Click **Import**.

Godot may take a moment the first time while it imports your files.

9

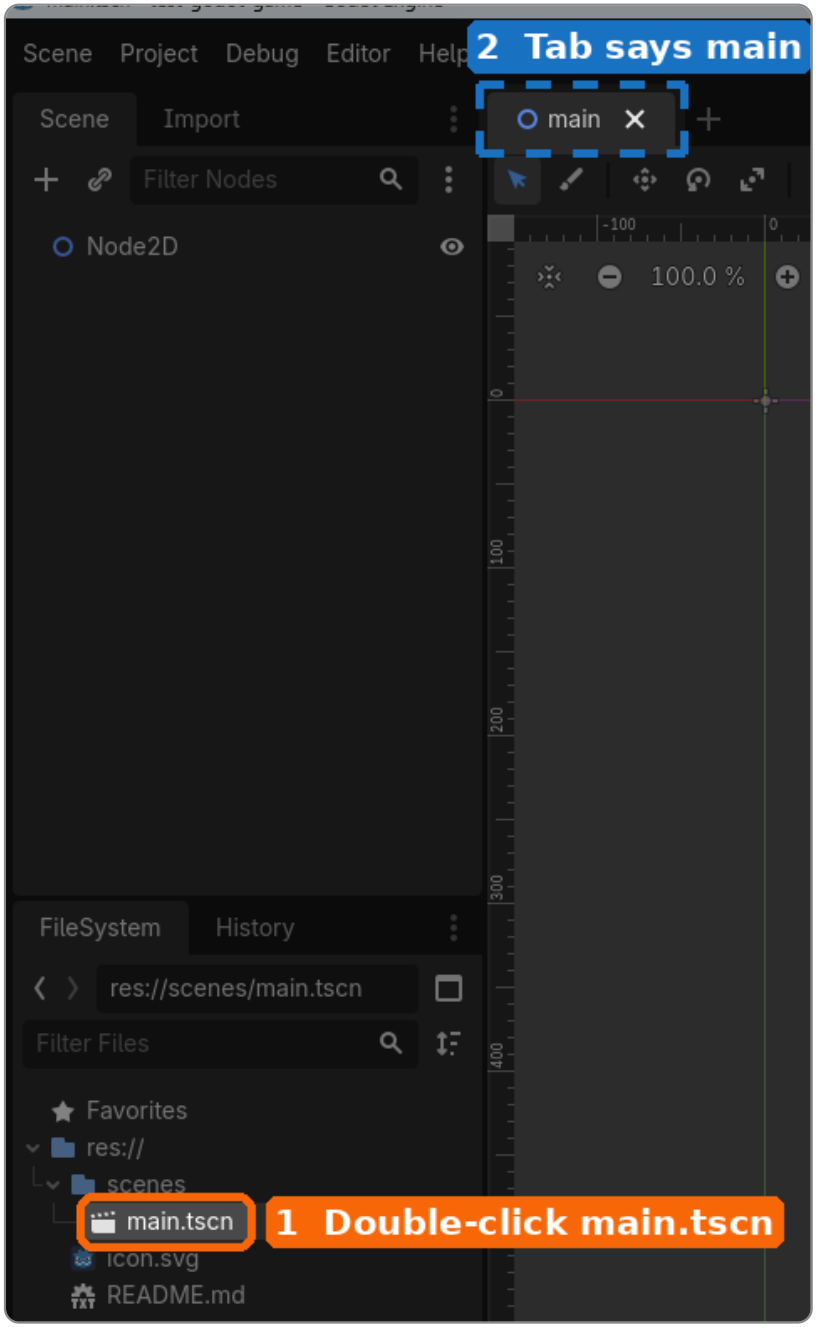

Godot › FileSystem

Open the `scenes` folder.

Double-click `main.tscn` (or the scene you want).

Godot opens with an empty tab on a new computer. Your scenes are all there.

> **Check:** your scene opens in its own tab.

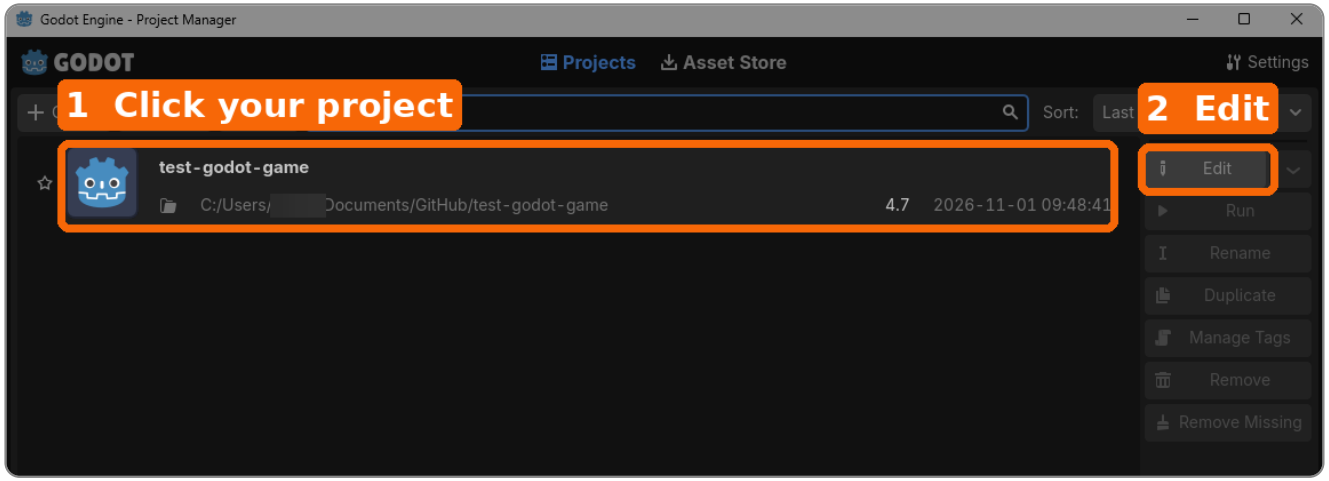

10

Godot › Project Manager › next lesson

Next time on this computer, click your project.

Click **Edit**.

You only import once on each computer.

Start of each lesson

Open GitHub Desktop and click **Fetch origin**. If it changes to **Pull origin**, click it to get your latest work. Then open Godot.

End of each lesson

Commit and push with GitHub Desktop, so your work is ready on any computer (see the guide Commit and push with GitHub Desktop).

Checkpoint

- [ ] I can clone my project into Documents › GitHub.
- [ ] I can import it into Godot.
- [ ] I pull at the start of a lesson and push at the end.
