# Make a Godot project

Digital Technologies · School computers

### You will

- open Godot from Start
- make a new, empty Godot project in `Documents` › `GitHub`
- open your project again next lesson

### You need

- a school computer or your own
- Godot downloaded into `Documents` › `Godot` (see the guide Download Godot)
- a name for your game, in lowercase with dashes, like my-first-game

### Before you start

- Godot doesn't need installing. The guide Download Godot puts it in Start for you.
- Your project goes in `Documents` › `GitHub`, so GitHub Desktop can back it up.

 Click here  Look here

**1**

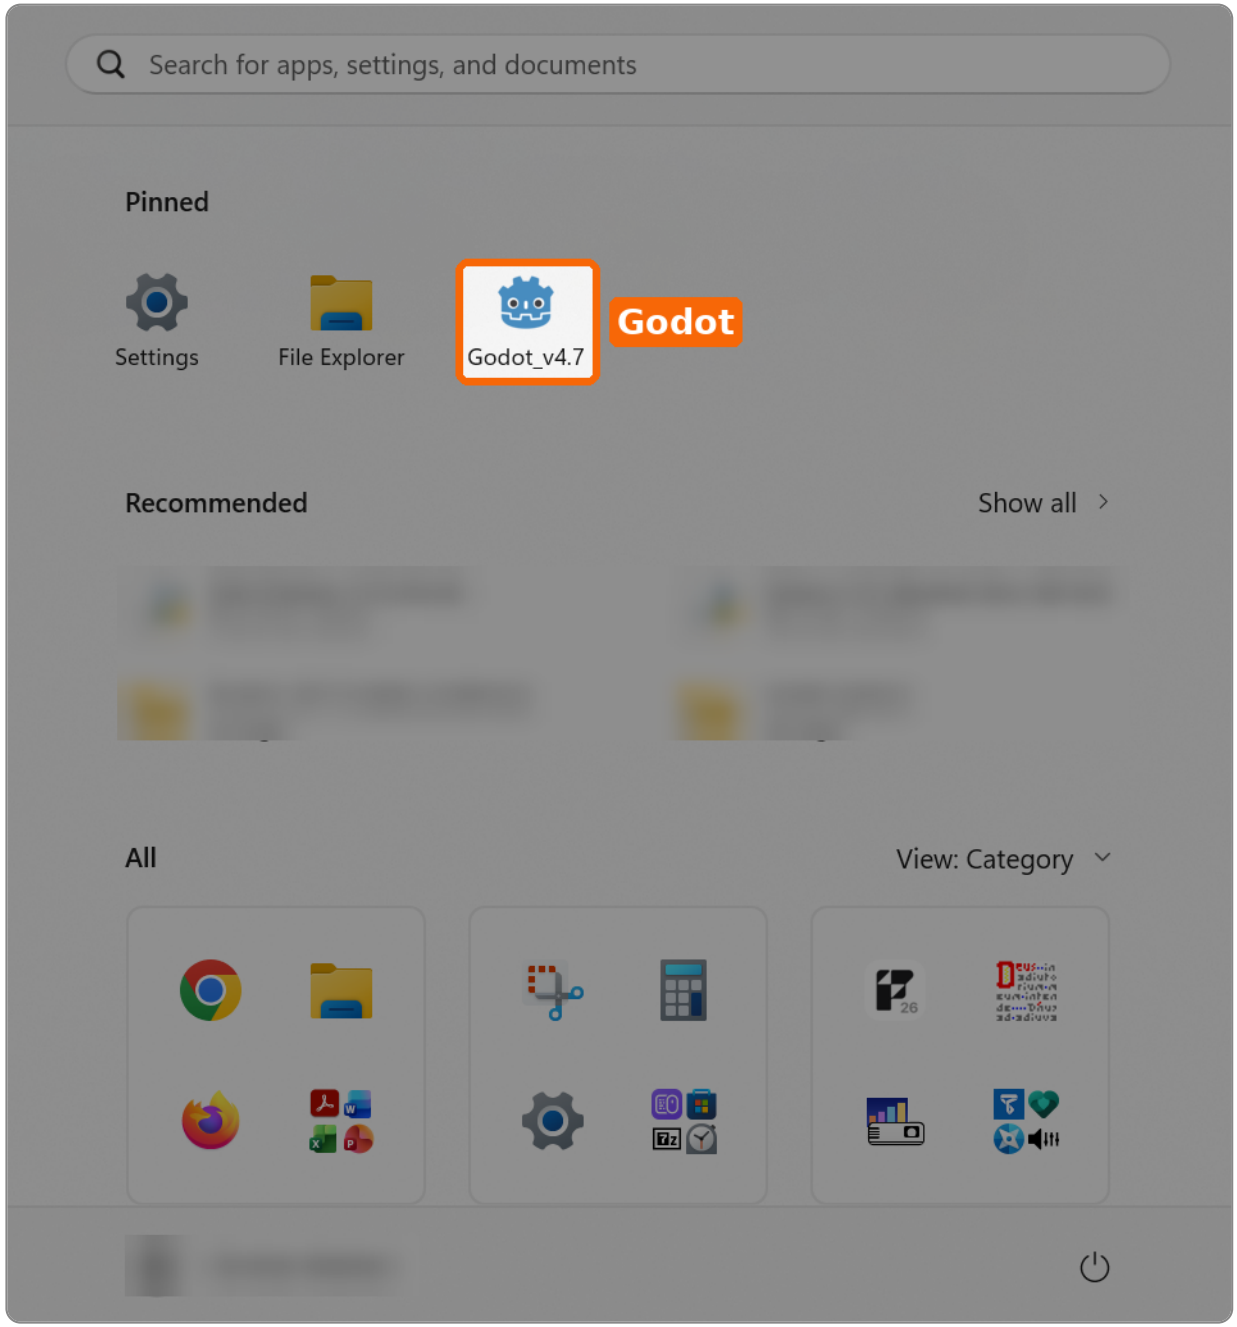

Windows › Start

Click Start.

Click Godot under Pinned.

> **Check:** Godot's **Project Manager** opens.

**If something goes wrong**
**Godot isn't in Start:** open `Documents` › `Godot` and double-click `Godot_v4…_win64`. No Godot folder? Follow the guide Download Godot first.

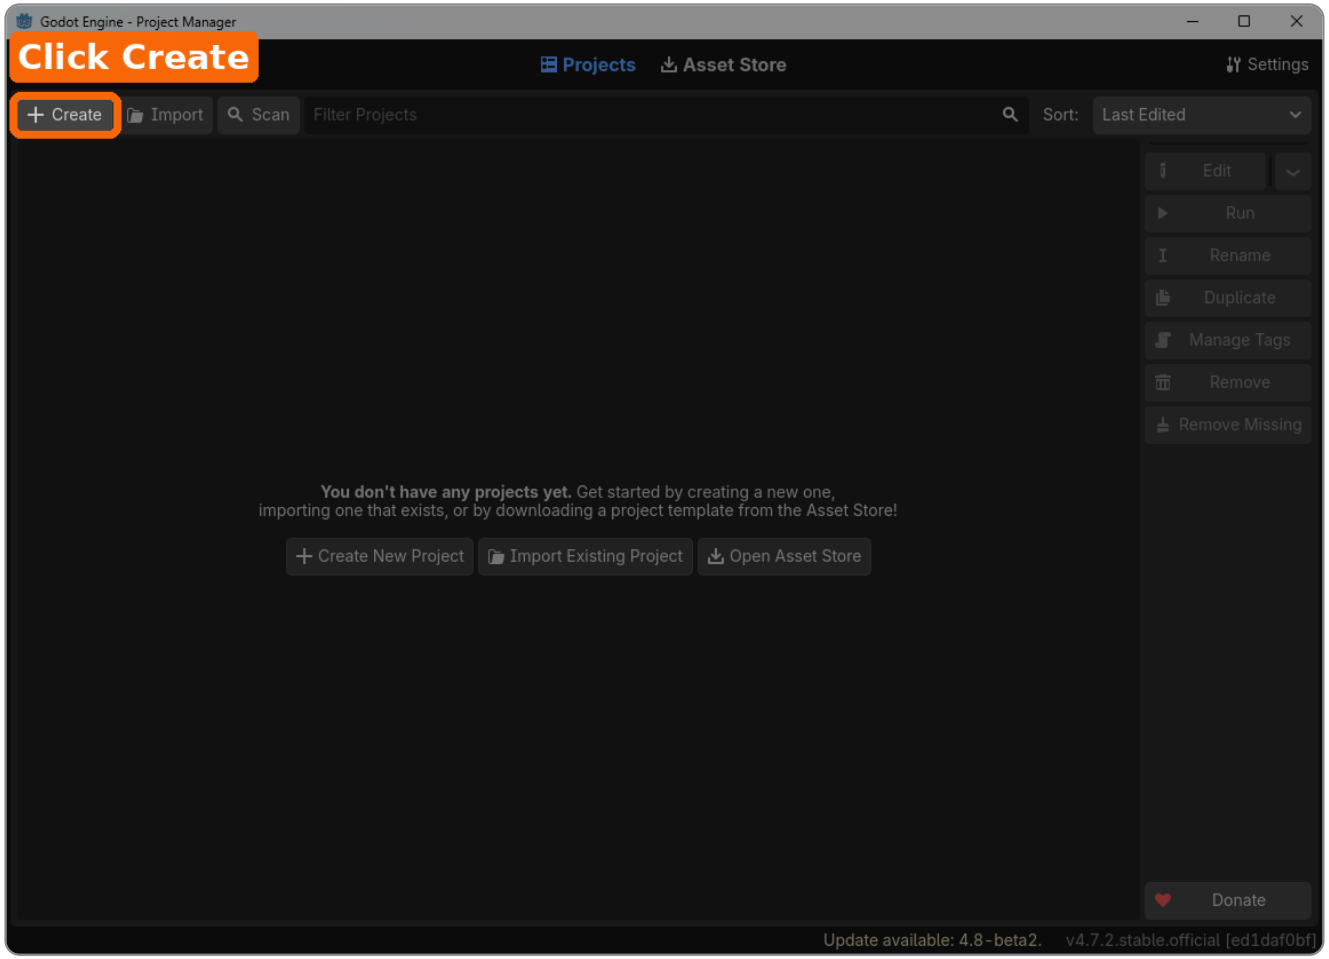

2

Godot › Project Manager

Click **Create**.

Ignore **Update available** at the bottom.
Use the version your kaiako gave you.

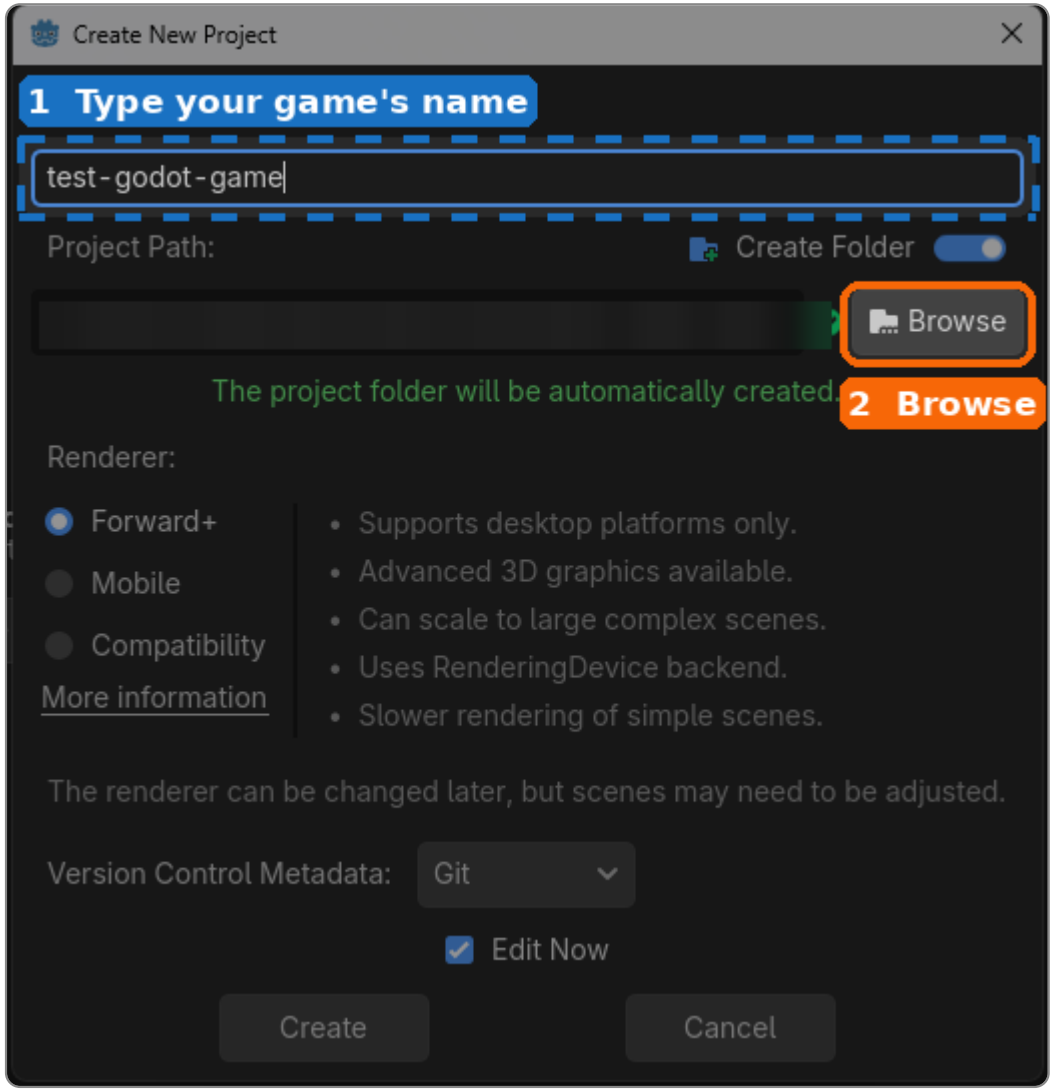

**3**

Godot › Create New Project

In **Project Name**, type your game's name.

Click **Browse**.

Use lowercase and dashes, with no spaces: `my-first-game`.

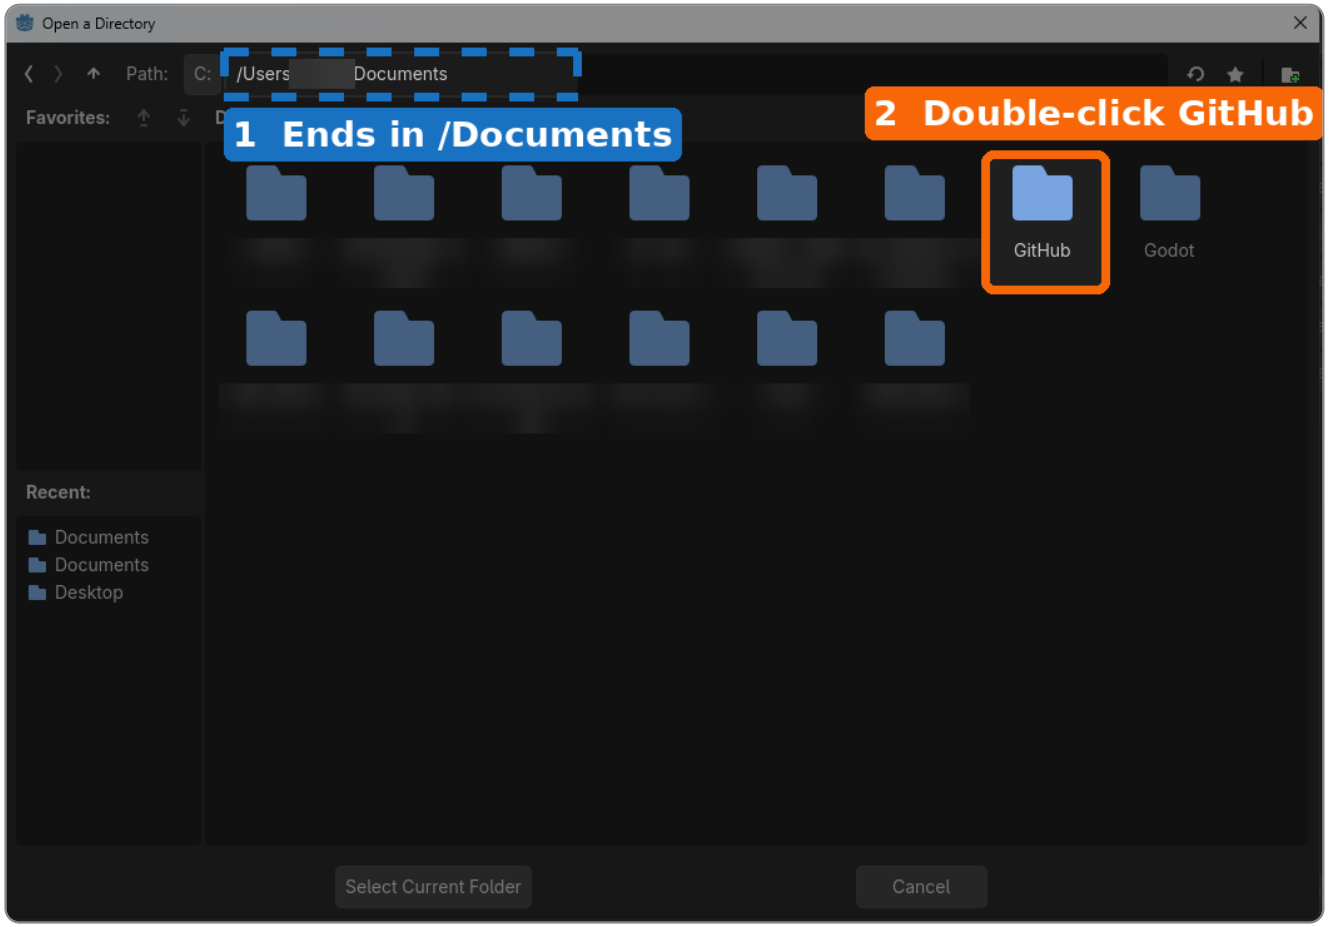

4

Godot › Open a Directory

Check the **Path** ends in `/Documents`.

Double-click the `GitHub` folder.

**If something goes wrong**
**No GitHub folder:** click the folder button with a green + (top right), type `GitHub`, then click **OK**.

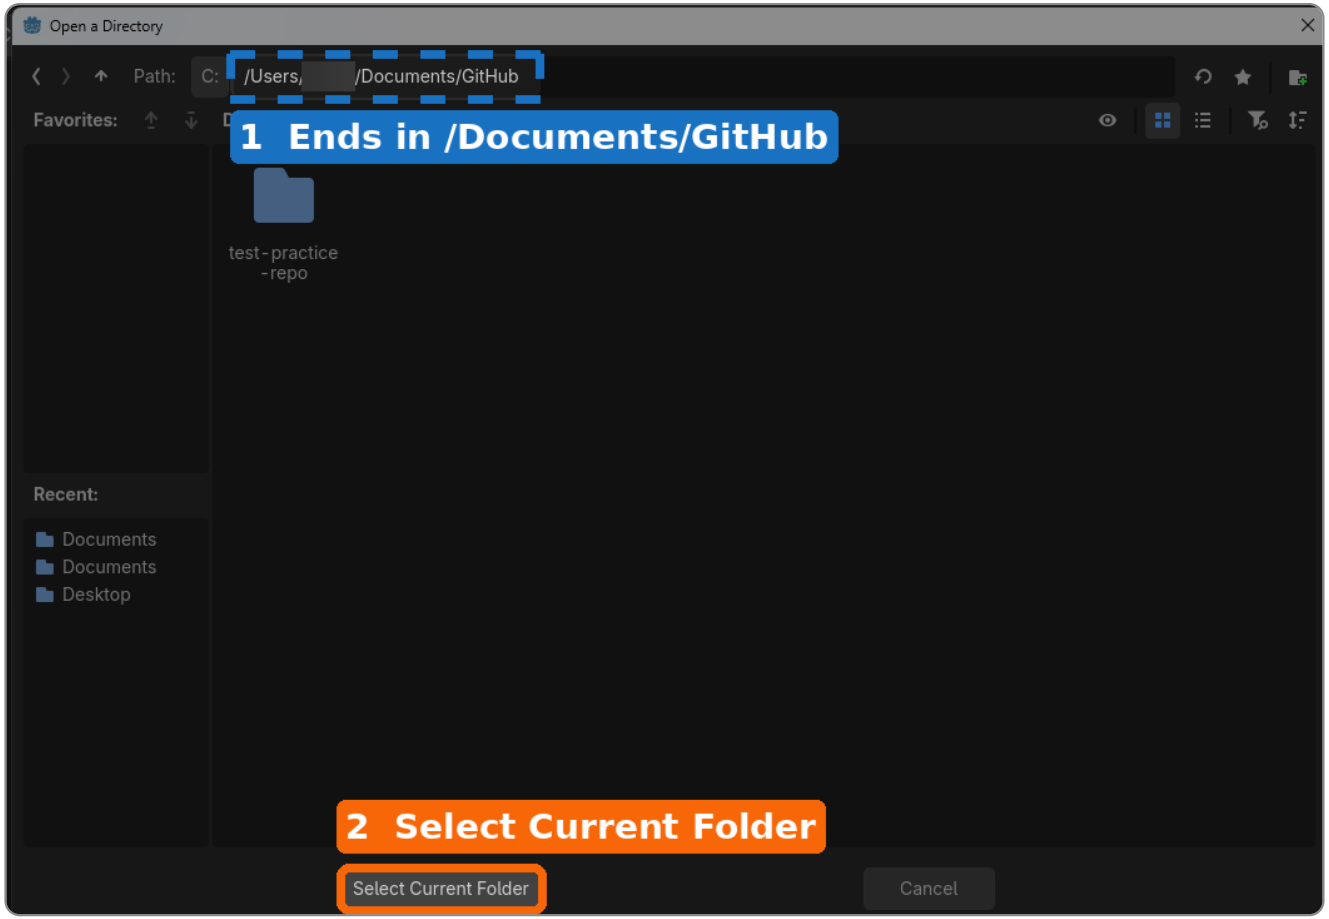

5

Godot › Open a Directory › GitHub

Check the **Path** ends in `/Documents/GitHub`.

Click **Select Current Folder**.

Don't open a folder inside GitHub. Godot makes your project's own folder for you.

6

Godot › Create New Project

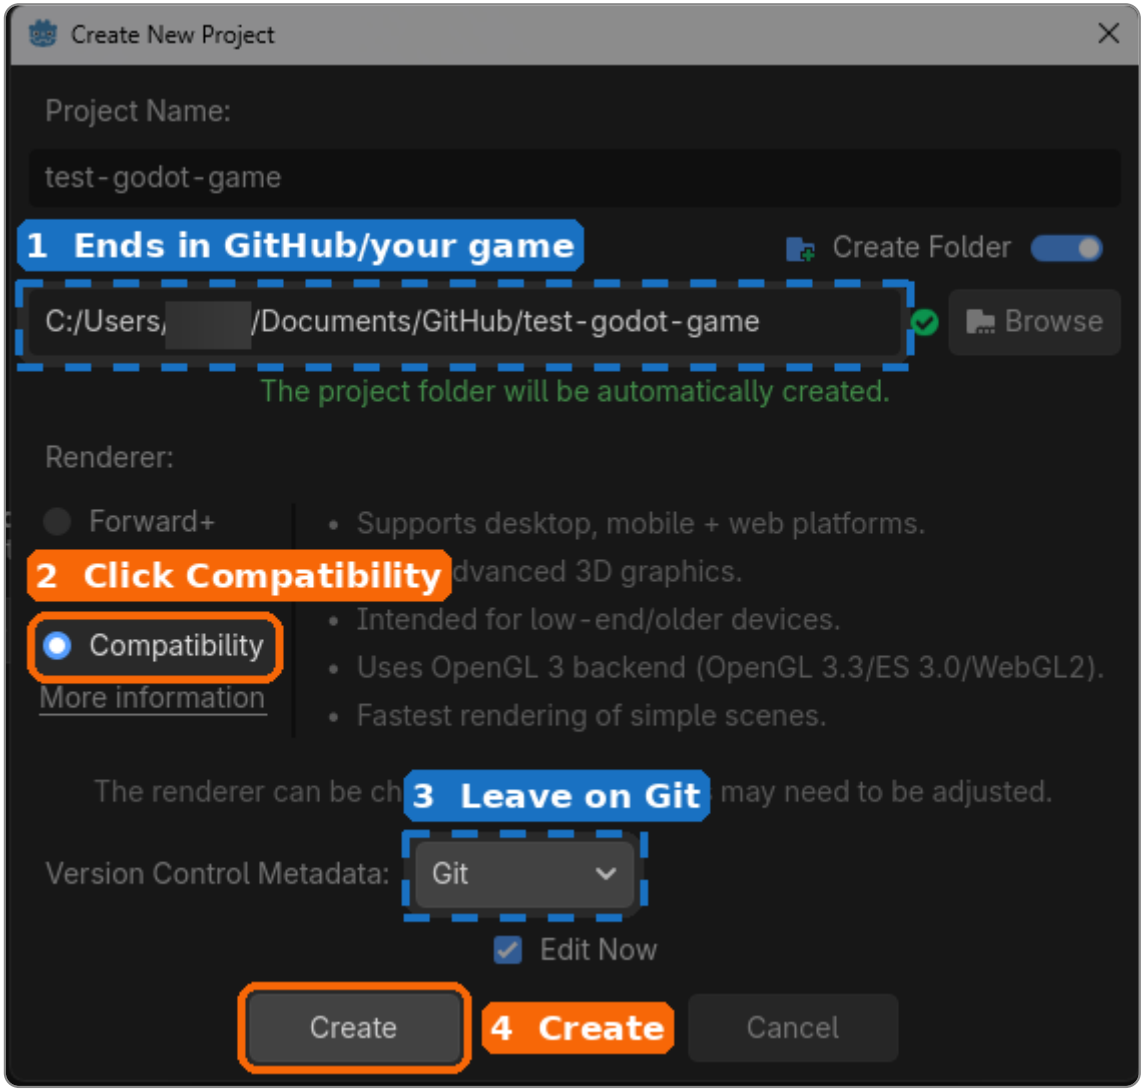

Check **Project Path** ends in `Documents/GitHub/` and your game's name.

Under **Renderer**, click **Compatibility**.

Leave **Version Control Metadata** on **Git**.

Click **Create**.

Compatibility is the only renderer that runs in a web browser, so you can share your game online later. Git adds a file that GitHub Desktop needs.

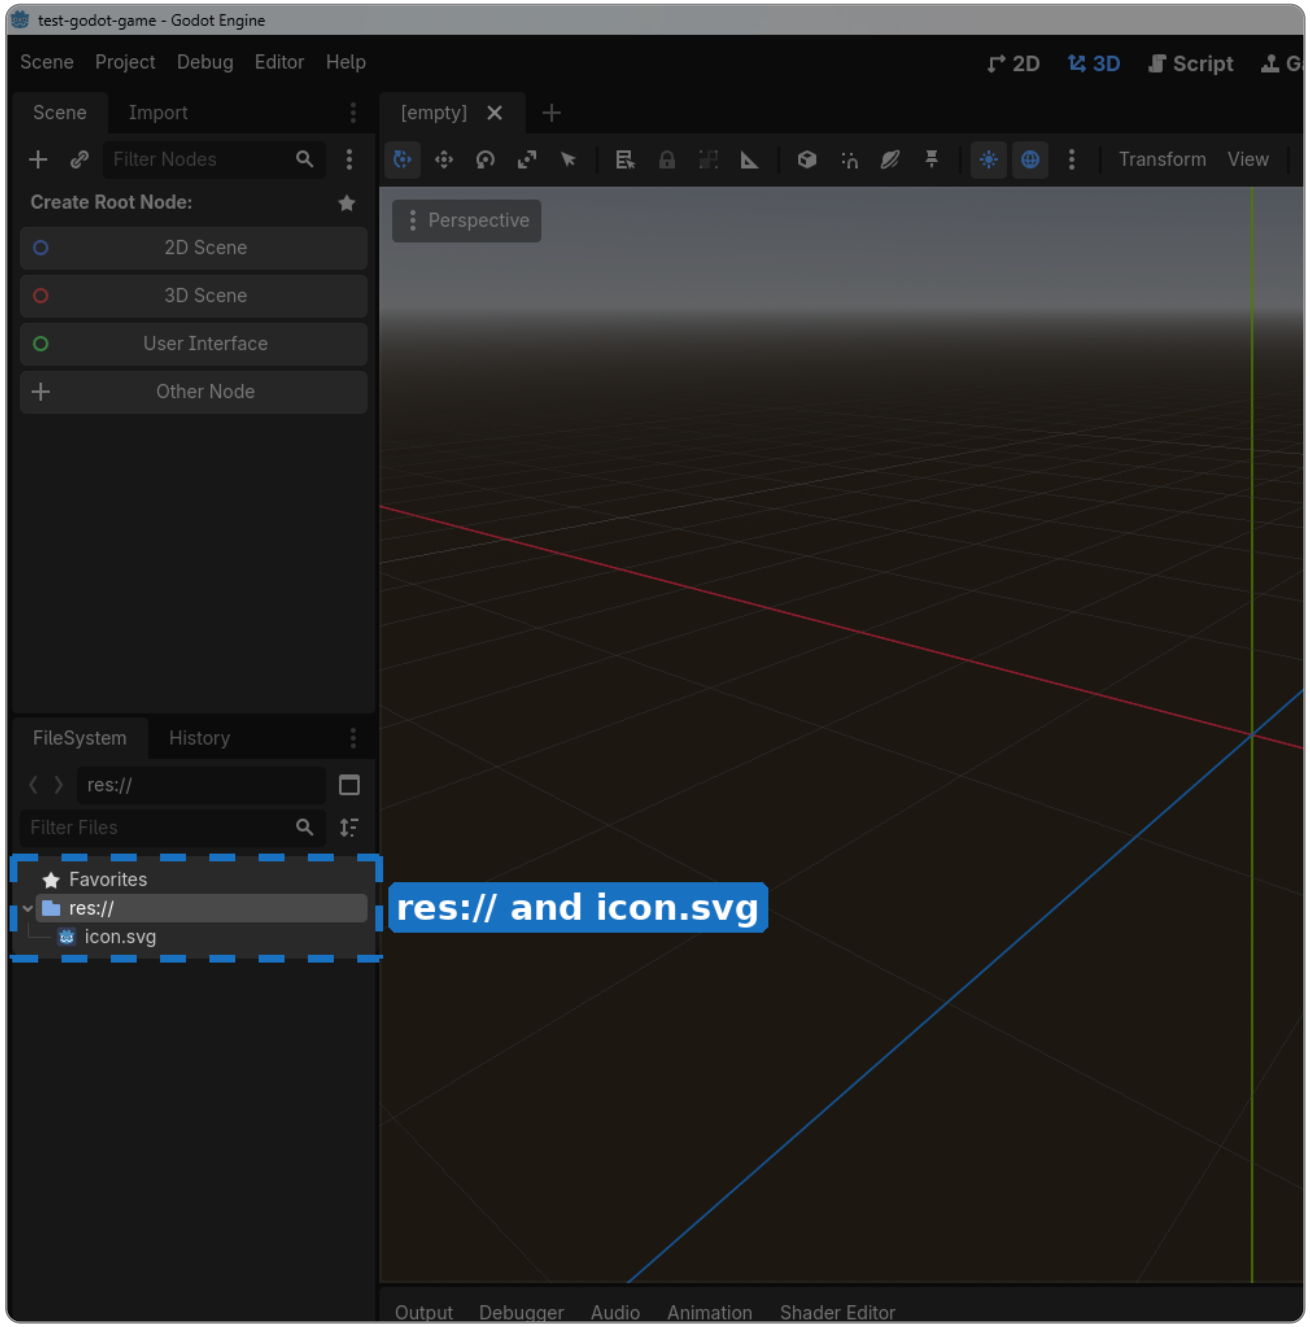

7

Godot › Editor

Wait while Godot opens your project.

Your project is empty. You'll add to it in the next guides.

> **Check:** the editor opens, and **FileSystem** shows `res://` and `icon.svg`.

## 8

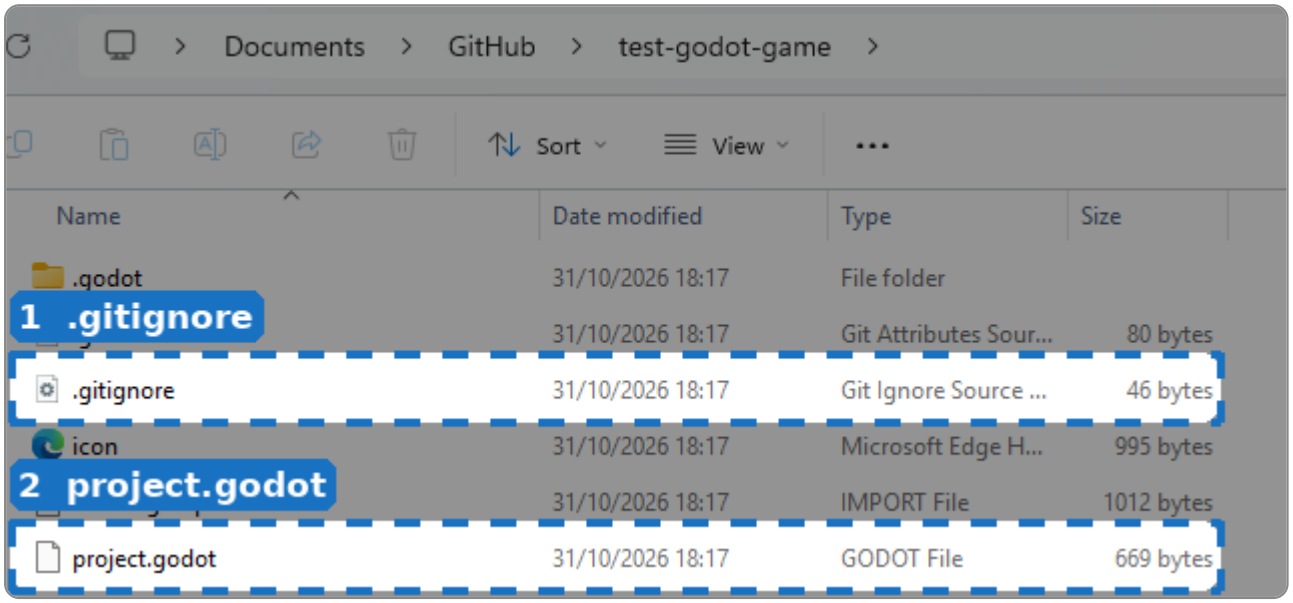

File Explorer › Documents › GitHub › your game

Open File Explorer.

Go to `Documents` › `GitHub` and open your game's folder.

Leave this folder where it is, and don't rename it. Godot and GitHub Desktop both look for it here.

> **Check:** you see `project.godot`, `.gitignore` and a `.godot` folder.

9

Godot › Project Manager

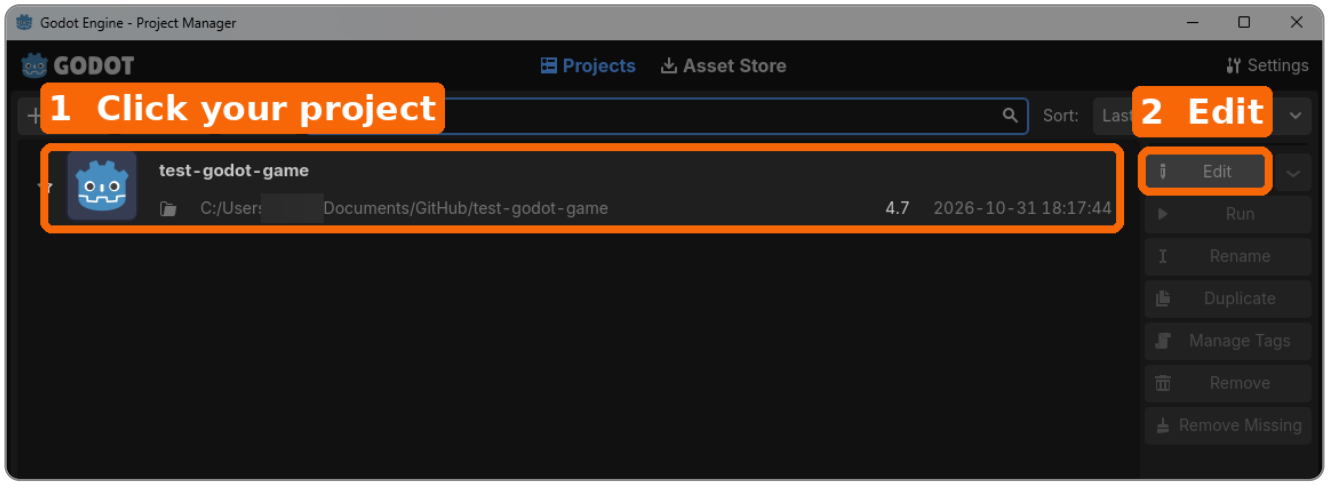

Next lesson: open Godot the same way.

Click your project.

Click **Edit**.

Godot remembers your project, so you only make it once.

**If something goes wrong**
**Your project isn't in the list:** you may be on a different computer from last lesson. Ask your kaiako.

**Opening Godot every lesson**
Click Start, then Godot. Then click your project and click Edit.

**Where your project lives**
Keep it in `Documents` › `GitHub`. Save it to GitHub with GitHub Desktop every lesson, because Documents stays on this computer.

**Checkpoint**

- [ ] I can open Godot from Start.
- [ ] I made a Godot project in `Documents` › `GitHub` with the Compatibility renderer.
- [ ] I can open my project again from Project Manager.
