Undo a mistake with GitHub Desktop

Digital Technologies · School computers

You will

- throw away changes you don't want
- undo a commit before you push it
- undo a commit you've already pushed

You need

- your Godot project on GitHub (see the guide Put a Godot project on GitHub)
- GitHub Desktop and Godot open

Before you start

- Find your situation, then do only the steps marked with its letter:
- **A** You saved changes in Godot but haven't committed them.
- **B** You committed, but haven't pushed.
- **C** You've already pushed.

 Click here  Look here

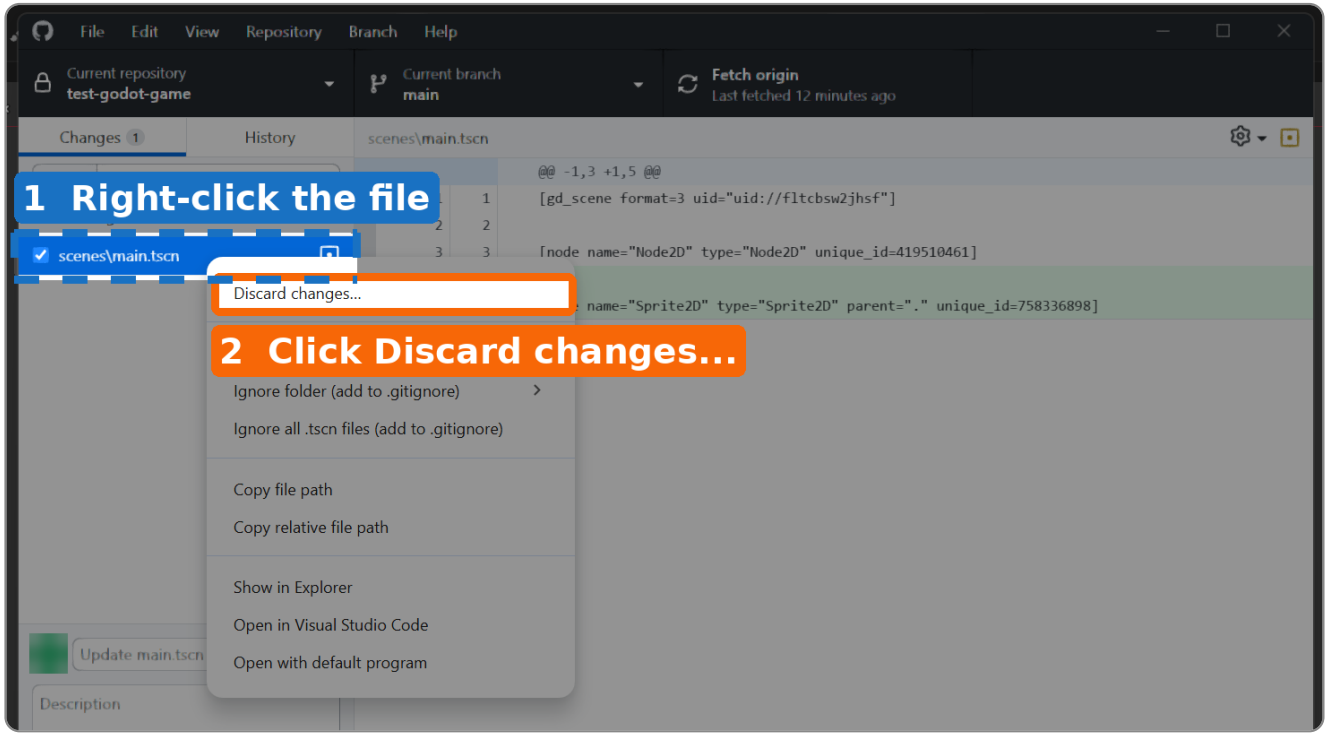

1

A · Not committed › GitHub Desktop › Changes

Right-click the file you want to put back.

Click **Discard changes...**

This puts the file back to how it was at your last commit.

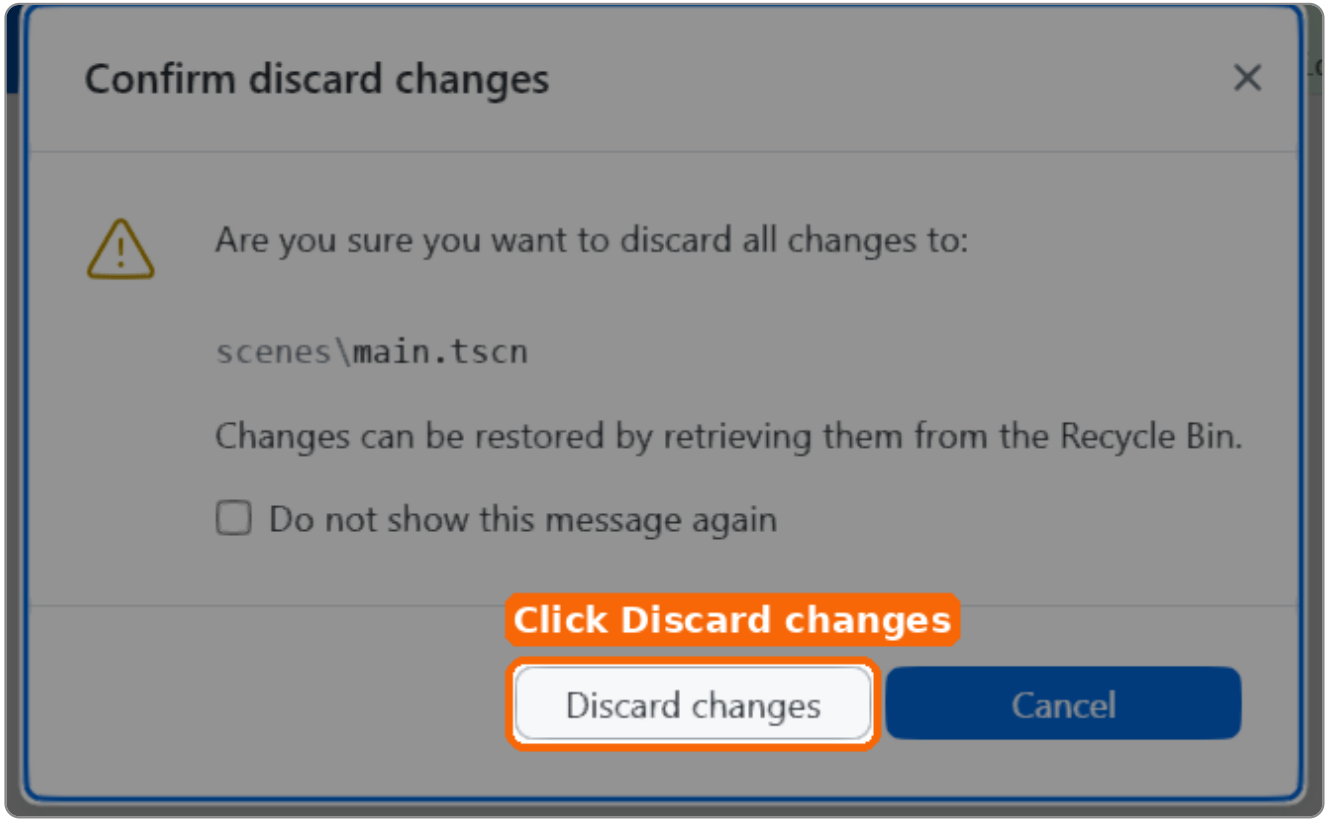

2

A · Not committed › Confirm discard changes

Click **Discard changes**.

Changed your mind later? The changes go to the Recycle Bin.

3

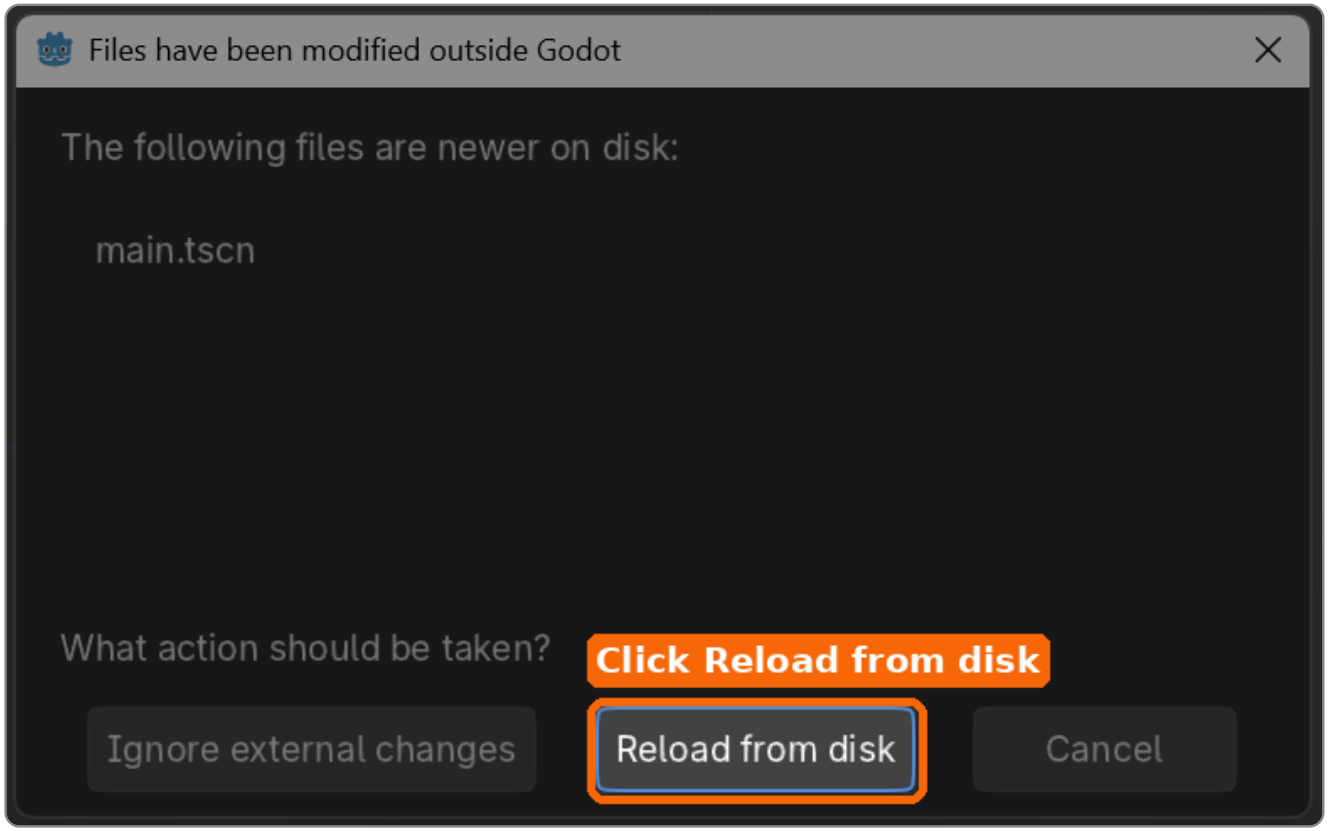

A · Not committed › Godot

Click **Reload from disk**.

Godot noticed the file changed and asks which version to keep.

> **Check:** your scene is back to how it was.

If something goes wrong
Godot didn't ask: close the scene's tab and open it again from **FileSystem**.

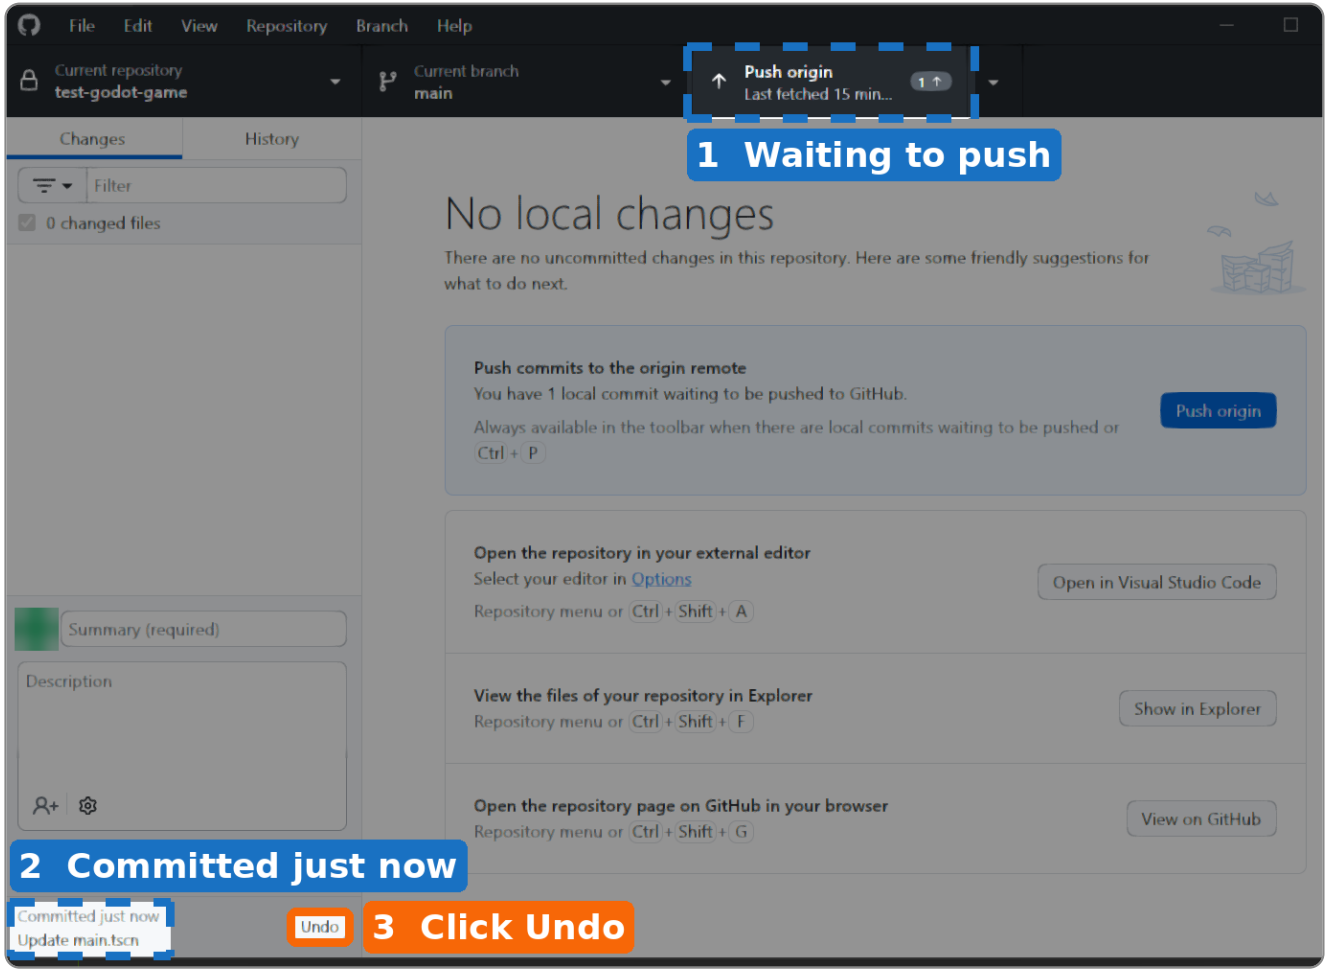

4

B · Committed, not pushed › GitHub Desktop › Changes

Check the bottom left says **Committed just now**.

Click **Undo**.

Undo is only there until you push. The top button shows `1↑` because the commit hasn't been pushed.

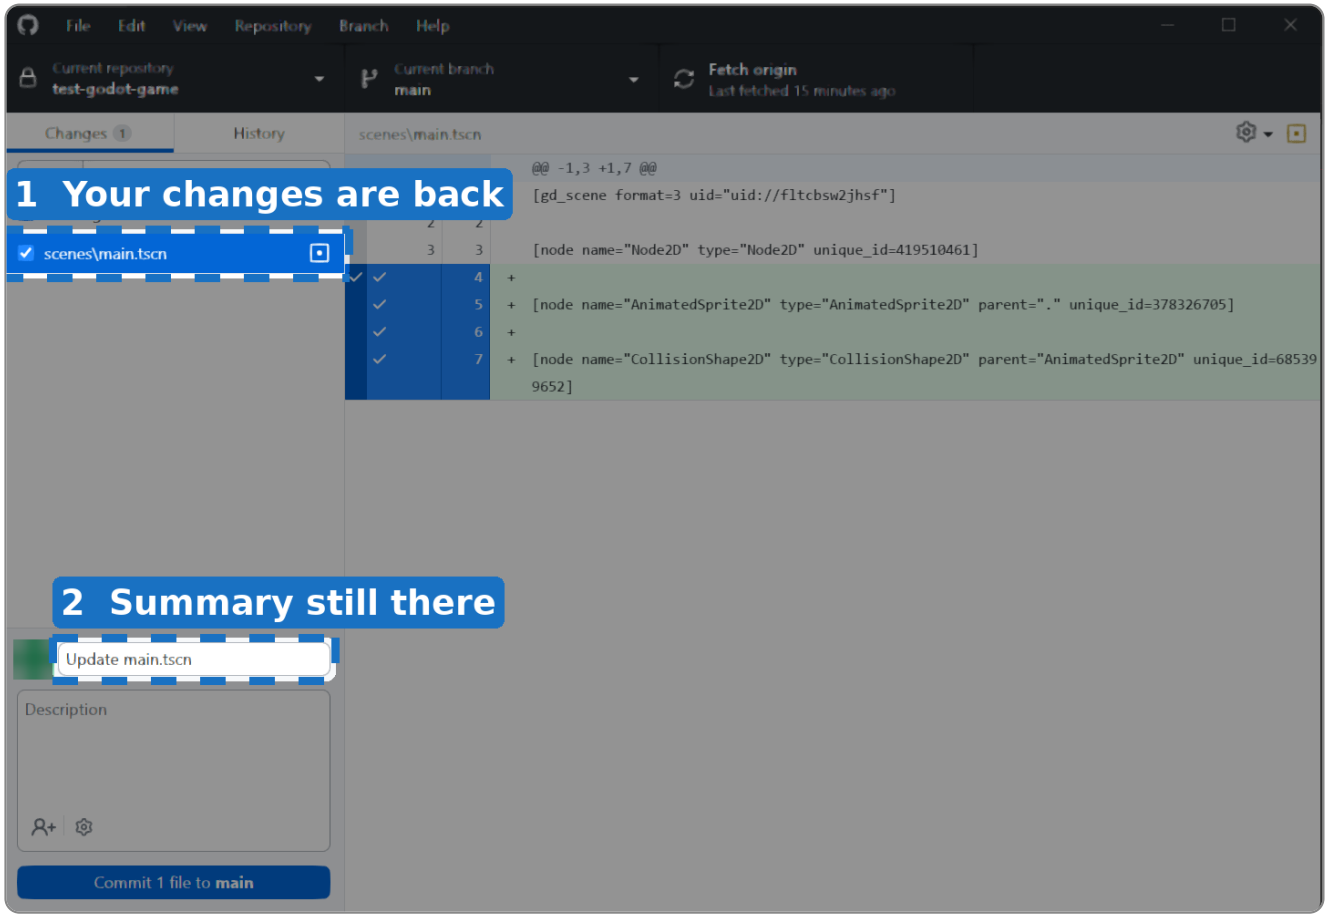

5

B · Committed, not pushed › GitHub Desktop › Changes

Your changes are back, and not committed.

Fix them and commit again, or discard them (the steps marked A).

Your summary is still there, ready to use again.

6

C · Already pushed › GitHub Desktop › History

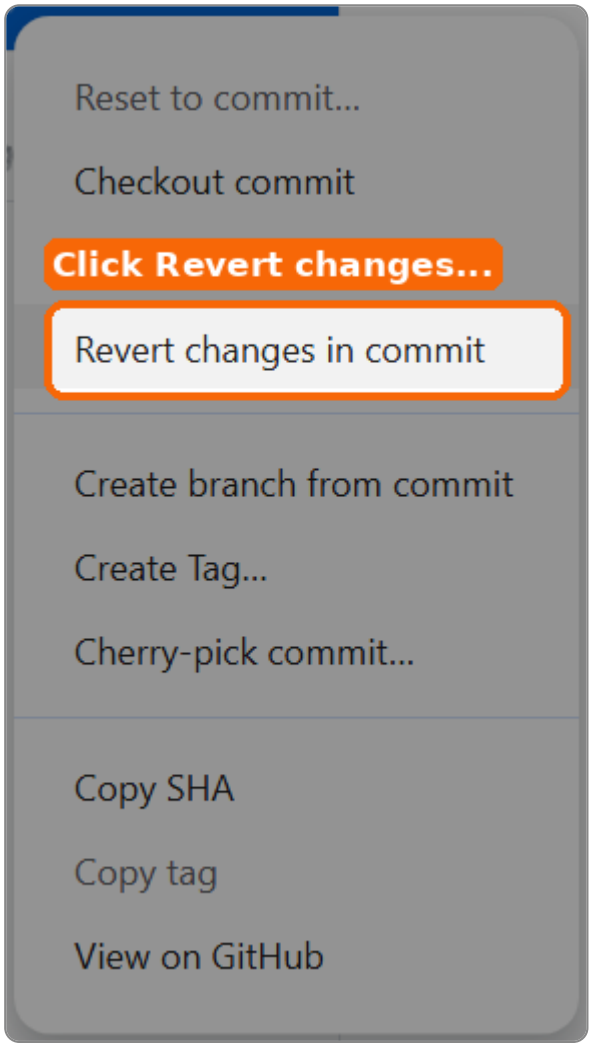

Click **History**.

Right-click your **newest** commit (the top one).

Click **Revert changes in commit**.

Revert makes a new commit that undoes the old one. Both stay in your history, so nothing is lost.

If something goes wrong
A CONFLICT error appears: you reverted an older commit that later commits changed. Click **Close** and ask your kaiako.

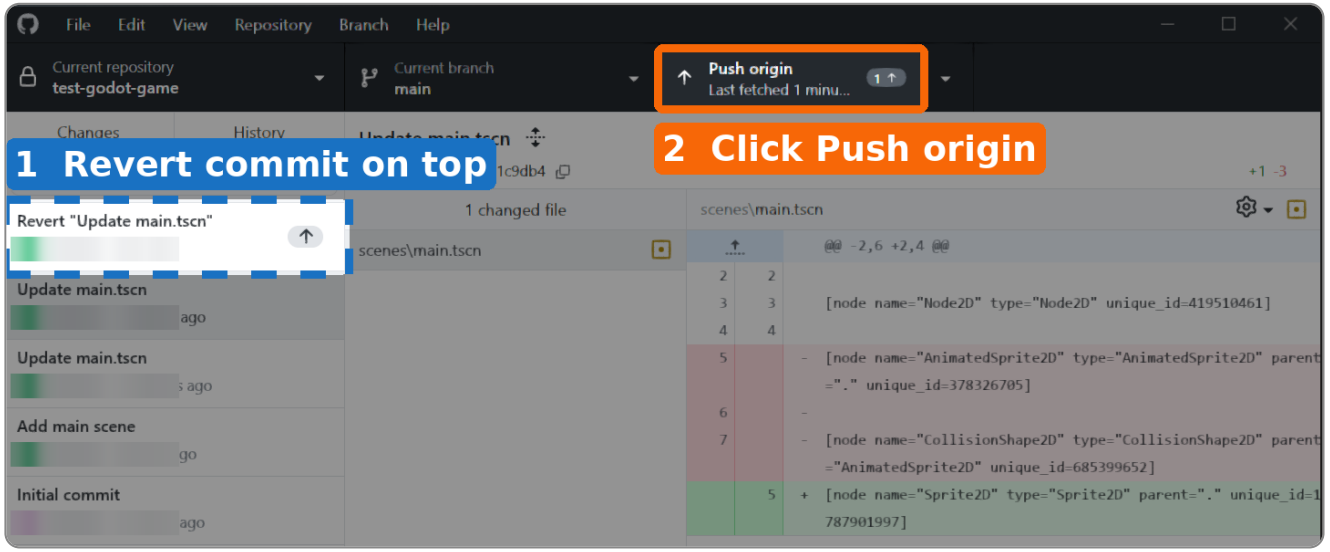

7

C · Already pushed › GitHub Desktop › History

Check a new `Revert` commit is at the top.

Click **Push origin**.

> **Check:** the button changes back to **Fetch origin**.

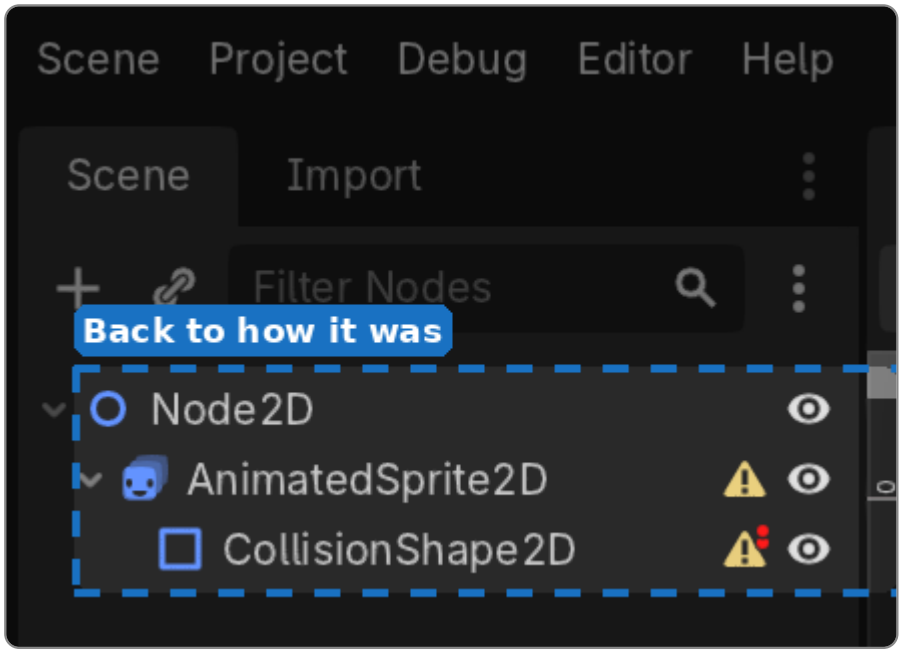

8

C · Already pushed › Godot

If Godot asks, click **Reload from disk**.

Check your scene is back to how it was.

Then carry on working, and commit and push with GitHub Desktop, as usual.

Revert newest first

Only revert your newest commit. To go back further, revert the newest one, then the next newest, one at a time.

Commit often

Small commits are easy to undo. Commit each time something works.

Checkpoint

- [ ] I can discard changes I haven't committed.
- [ ] I can undo a commit I haven't pushed.
- [ ] I can revert a commit I've already pushed.
