Summative Assessment

Resource title:	**My Passion Page**
Course:	9DGT · Year 9 · Term 4 2026
Progress outcomes:	DDDO PO2 and DDDO PO3
Resource reference:	9DGT DDDO2/DDDO3 A v1

Student/Ākonga instructions

Introduction/Kupu Arataki

You will build a one-page website about something you love, such as a sport, hobby, game, food or place. You write it for one real reader: a person or group who doesn't know much about it yet.

This must be your own work. You must not use generative AI (tools that write text, code or images for you) at any stage. Read the Plagiarism poster: copying even one sentence is plagiarism.

You have 9 periods over 3 weeks, with two checkpoints. Fill in your template as you go. The rubric at the end shows each grade; **4A** (★) is the expected standard.

Task/Hei Mahi

Keep it private. Don't include your full name, address, phone number or school. Don't use photos that show people's faces or where you live.

Your reader. In the gallery walk, classmates read your page as if they were your reader.

Part 1: Plan (Week 1)

1. Choose your topic and one real reader: a person or group, not "everyone".
2. In your template, write your `<title>` and `<h1>`, and list what your reader needs from your page.
3. Write your opening paragraph. Choose three questions for your sections and answer each in 2–3 sentences.
4. Choose at least three images. At least one must be a photo you took. Others must be free to use (for example from Unsplash or Pexels), with the source written down.
5. Save photos as .jpg or .png, not .heic (iPhone: **Settings** › **Camera** › **Formats** › **Most Compatible**). Name each file in lowercase with no spaces, for example `muddy-boots.jpg`.
6. Write alt text for each image (one sentence describing it for someone who can't see it). Choose a background, heading and text colour that are easy to read together.
7. In File Explorer, open **Google Drive** › **My Drive**. Make a folder called `my-page` with an `images` folder inside. Put your images in `images`.
8. In VS Code, open `my-page` (**File** › **Open Folder**) and make a file called `wireframe.drawio.png`. In Draw.io, draw boxes showing where everything goes.
9. In your template, explain how your content, images, colours and layout meet your reader's needs.

10. Paste your wireframe into your template. Show your plan to your kaiako at Checkpoint 1.

Template: your top of page, opening paragraph, three sections, pictures, colours and wireframe.

Part 2: Build (Week 2)

1. In VS Code, make `index.html` and `style.css` in `my-page`. In `index.html`, add your title, heading, opening paragraph and three sections. Indent your code.
2. Add each image with an `<img>` tag and its alt text. Use a relative path (the route from `index.html` to the file), for example `images/muddy-boots.jpg`.
3. Link `style.css` in the `<head>`. Put all your colours, fonts, spacing and image sizes in `style.css`, not in `index.html`.
4. Right-click `index.html` and click **Open with Live Server**. Chrome shows your page and refreshes when you save.
5. Make your layout match your wireframe. Use CSS to set spacing, font sizes and image sizes so your page is easy to read.
6. Each time something breaks, write the problem and your fix in your template.
7. Fill in your choices table: what you used, what it does or a key feature that helped, and why it suits your page better than another option.
8. Explain how you organised and named your files, and how saving in Google Drive keeps your work safe.
9. Show your page running in Live Server to your kaiako at Checkpoint 2.

Template: problems you fixed, your choices table and your folder explanation. Your kaiako judges your code from your zip (no screenshots needed).

Part 3: Test, get feedback and improve (Week 3)

1. Do each test in your template, plus one test of your own. Write what happened and what you changed. For the narrow-window test, drag Chrome to about phone width.
2. Gallery walk: leave your page open in Live Server. Read classmates' pages as their reader. Tell each one thing that works and one thing to change.
3. Write feedback from at least two classmates in your template. Make at least two changes from it.
4. Write your evaluation: how well your page suits your reader, using your tests and feedback. Include changes from your plan and what to improve next.
5. Check your page has no personal information. Explain how your alt text, colours and wording help your reader, and your privacy choices.

Template: your tests, feedback, changes, evaluation and "Helping my reader and keeping it safe".

Submitting your work

Delete any files you don't use from `my-page` (keep your wireframe). In File Explorer, right-click `my-page` and click **Compress to ZIP file** (or **Send to** › **Compressed (zipped) folder**).

Upload the zip and your template in Google Classroom and click **Turn in** by Friday 13 November 2026. Your work is judged as it is on that date.

Assessment rubric/Mahere Aromatawai: My Passion Page

The expected standard for this task is **4A** (marked ★). Each strand gets the grade its evidence best fits. Each grade includes everything in the grades to its left.

Strand	4B	4P	4A ★	5B	5P	Grade
Planning and design DDDO PO2, DDDO PO3 Evidence: Part 1, Part 3	Plan names a topic and some page content. The reader or the wireframe is missing or unclear.	Plan names a real reader and has a title, heading, opening paragraph, three sections (school-set) and a wireframe.	Plan lists what the reader needs. The content, images and colours in the plan suit those needs.	Wireframe shows where every section, image and colour goes. The page follows it, or the evaluation explains changes.	Plan explains how the content, images, colours and layout each meet the reader's needs.	
Building the page DDDO PO2, DDDO PO3 Evidence: The zip: index.html and style.css, opened with Live Server	`index.html` shows some content in Chrome. Some tags or the CSS link may not work.	Page has a title, h1, opening paragraph and three h2 sections (school-set). `style.css` is linked and sets colours. Code is indented.	All required parts work, including 3+ images (school-set). All styling is in `style.css`, none in `index.html`.	CSS spacing and font sizes make the text easy to read, and images are sized with CSS to fit the layout.	No broken tags or links, and the layout still works in a narrow Chrome window.	
Software and file types DDDO PO2, DDDO PO3 Evidence: Part 2	Names the software used to build the page.	Uses VS Code and Live Server to build and preview the page. Images are .jpg or .png files.	Explains what VS Code, Live Server and Draw.io each do, and why each image has its file type.	Names a key feature of each tool that helped (for example Live Server's auto refresh), and why CSS has its own file.	Explains why each tool and file type suits this page better than another option, for example .jpg or .png for a photo.	
File management DDDO PO2, DDDO PO3 Evidence: The zip (folder, file names, image paths) and Part 2	Files are saved in Google Drive, but names or folders are mixed up and some images don't load.	Files are in one `my-page` folder with `index.html`, `style.css` and an `images` folder.	All file names are lowercase with no spaces. Every image loads from `images` using a relative path.	Explains how the folder is organised and why the naming rules matter, for example a space can break a path.	Zip has no unused or duplicate files. Explains how saving in Google Drive keeps the work backed up and private.	
Testing, feedback and improving DDDO PO2, DDDO PO3 Evidence: Part 2, Part 3	Opened the page in Chrome to check it. A few problems are noted.	Tests the page in Chrome and records what happened. Records feedback from at least one classmate.	Records each test, its result and the fix, and problems fixed while building. Makes at least one change from feedback.	Does every listed test plus one of their own. Makes two or more changes from two classmates' feedback.	Evaluation uses test results and feedback to judge how well the page meets the reader's needs, and says what to improve next.	
Reader, ethics and privacy DDDO PO3 Evidence: Part 1, Part 3	Names who the page is for.	Page has no personal information (full name, address, phone, school). Image sources are listed.	Every image has alt text that describes it. At least one is their own photo (school-set); others are free to use, with sources.	Explains how the alt text, colours and wording help their reader, including someone who can't see the images.	Explains their privacy choices and why they matter on a page other people can see.	

The descriptors are indicative. Judge equivalent evidence in each ākonga's own context.

Overall grade

Grade	What this looks like overall	Overall
4B	A page was started, with a plan or some working HTML. Several required parts, tests or explanations are missing.	
4P	A working page with the required sections and linked CSS, made for a named reader. It was tested and had some feedback.	
4A ★	A complete page with images, alt text and tidy files, planned around the reader's needs. Tests and feedback led to changes, and choices are explained.	
5B	A well-organised page that follows a full wireframe. Tests and feedback were thorough, and tool, file and reader choices are explained with reasons.	
5P	A polished page where design, files, testing and privacy choices are explained and judged against the reader's needs, with clear next steps.	

The overall grade is a best fit across the six strands, not an average. Use professional judgement about the evidence as a whole.
